## B

## SYNTHESIS OF NEW HETEROPOLYCYCLIC COMPOUNDS WITH POTENTIAL ANTITUMOR ACTIVITY

Doctoral thesis submitted by Richard Soucek, Master's degree in Chemistry to obtain the PhD degree by the university of Barcelona.

This third cycle study was performed in the Chemistry PhD program 2009-2013 of the university of Barcelona. This thesis has been conducted under the guidance of Dr. Maria Dolors Pujol in the Laboratory of Pharmaceutical Chemistry of the Faculty of Pharmacy at the University of Barcelona in the years 2009-2013. The experiments and the redaction of the thesis were carried out in the supervision of the professor $\mathbf{M}$. Dolors Pujol Dilmé.

Barcelona, 28 of june 2013.

Thesis Supervisor:
PhD student:

## Acknowledgment

First and foremost it is with immense gratitude that I acknowledge the support and help of my supervisor Dr Maria Dolors Pujol Dilmé for giving me the opportunity to do both my master training and my PhD in her team as nothing would have been possible without her. Many thanks to her for her valuable advice and guidance throughout my PhD, for her remarkable kindness and her financial support. She was always there for me during good times and hard times, so that is why I will always be grateful to her.

It would not have been possible to write this doctoral thesis without the help and support of the kind people around me, to only some of whom it is possible to give particular mention here. It gives me great pleasure in acknowledging the support and help of Dr Nuria Mur Blanch and Dr Joan Basset who taught me a lots of lab skills that will be very valuable for my future career. I am indebted to Raul Berdun Bosch, Laia Vilaró Jaques, Alba Figuera Figuera, Judit Ramos Martinez, Edith Zambrana Segalés, Luis Coronel, and Gemma Sangüesa Puigventós for teaching me and tchatting with me a lot at the beginning of my phD. Thanks to them, I really made a lot of progress in Spanish. I am most grateful to Manel Romero for introducing me to astronomy and physique quantique and teaching me a lot of additional experimental techniques. Thanks goes to the two Italians Giovanni Casula and Matteo Cassina for going out with me at night and introducing me to the bars, night clubs and parties of Barcelona. Thanks goes to Salha Hamri for chatting with me in French and sharing her chemistry experience with me. I cannot find words to express my gratitude to Jose Rodriguez Morato for his friendship and emotional support throughout my PhD. I really enjoyed our philosophical discussions at lunch time. Many thanks also go to Lorena Navarro Rivera for bearing our philosophical discussion without complaining. Thanks for her kindness and patience and for occasionally bringing me candies and lollipops in the lab. Thanks to Alex Martin Serrano and Ruben Maldonado Risquez for having entertaining lunches with me. A special thank goes to Ruben for having proved using the university diet software that my diet was balanced. Thank you Monica Morera Ruocco, Angela Ruiz Lambea, Belina Frutos Burgos and Nuria Pequeña for spending with me the most
entertaining summer of my PhD. Thank you Laura Grau Valls and Anna Muntalt Moner for sharing good times with me. I owe my deepest gratitude to Arturo Vinuesa Hernando alias "Arturo el 8" for the fun moments we spend together, and for introducing me to the restaurant "Los 100 montaditos" that allowed me to drink cheap tasty beer and food. My sincere thank go to Martina Giuppi for keeping me company during the writing of my thesis, for inviting me in Italy for her final year presentation and introducing us to the city of Milan and to her lovely family. I would like to thank Oskan Sari for his kindness, friendship and support throughout my first 6 months in Barcelona. Many thanks go to Marina Corbella for explaining to me some NMR notions that I did not completely understand. Thank you Vanessa Prieur for giving me lots of tips and useful information on the writing of my thesis and on experimental skills. Thanks go to Andrea Galli for teaching me new dating techniques.

Many thanks to the Peruvian family I stayed with who provided me with a place to live during my first 6 months in Barcelona. They accepted me as a member of their family, taught me a lot of Spanish and provided me with everything I needed to settle down. Their help will never be forgotten. Many Thanks goes to my two housemates Jose Lopez and Jordi Chimeno for their friendship and support. Harmony at home is very important for happiness in everyday life, and it was a priceless gift to them to do everything to make me feel at home. Thank you Jose Lopez for playing videogames with me and sharing your mangas and drawing interests. Thank you Jordi Chimeno for accompanying me to Barcelona's $10 \mathrm{Km}, 21 \mathrm{Km}$ and 42 Km running events that physically and mentally strengthened me a lot and helped me keep a good mental and physical balance. Many thanks to everybody who visited me in Barcelona, because life is more entertaining sharing good moments with friends. A big thank you for Guillaume Sartori and Laurent Lehenaff for sharing their thesis experience with me and cheered me up a lot during difficult moments. A big thank you goes to my brother Frédéric Soucek, and our mutual friends Kevin Raimundo and Pierre Dolivet for entertaining me a lot during holidays. Last, but by no means least, I would like to thank my parents who emotionally and financially supported me during all these years.

Richard Soucek.

1. Introduction

## 1. Introduction

### 1.1. Cancer

### 1.1.1. Definition of cancer

Cancer represents a broad group of various diseases, all involving unregulated cell growth. Cells divide and grow uncontrollably, forming malignant tumors and invading nearby parts of the body through metastasis. ${ }^{1}$ There are more than 100 different types of cancer. Most of them are named for the organ or type of cell in which they start. For example, cancers that begin in the colon are called colon cancer, cancers that begin in basal cells of the skin are called basal cell carcinoma. The main categories of cancer include:

- Carcinoma - cancer that begins in the skin or in tissues that line or cover internal organs.
- Sarcoma - cancer that begins in bone, cartilage, fat, muscle, blood vessels, or other cconnective or supportive tissue.
- Leukemia - cancer that starts in blood-forming tissues such as the bone marrow and ccauses large numbers of abnormal blood cells to be produced and enter the blood.
- Lymphoma and myeloma - cancers that begin in the cells of the immune system.
- Central nervous system cancers - cancers that begin in the tissues of the brain and sspinal cord. ${ }^{2}$

### 1.1.2. Endogenous and exogenous factors: limits to cancer prevention

Most cancer cases comes from exogenous factors (90-95\%). Few comes from endogenous factors (5-10\%). ${ }^{3}$ The exogenous factors include:

- Diet, physical unactivity and obesity (30-35\% of cancer cases). ${ }^{4,5,6,7}$

[^0]- Chemical exposure ( $25-30 \%$ of cancer cases). ${ }^{7}$ This includes tobacco smoking ${ }^{8,9,10 \text {, (one in }}$ three of all cancer death is the develloped world), ${ }^{11}$ alcohol ${ }^{12}\left(3.5 \%\right.$ of cancer deaths) ${ }^{13}$ and exposure to carcinogenic substances in one's workplace or occupation (200,000 death per year). ${ }^{14}$
- Infections ${ }^{15}$ ( $18 \%$ of cancer cases) ${ }^{7}$ from viruses (herpes, hepatitis or human papillomaviruses), bacterias ${ }^{16,17}$ or parasites. ${ }^{18}$
- Radiations ${ }^{1,19}$ ( $10 \%$ of cancer cases). ${ }^{20}$
- Aging. One of the principal cancer risk factors is aging. Two third of cancer happens after 65 years old, mostly due to the accumulation of nonlethal DNA mutation that is passed on to subsequent cell divisions.

The endogenous factors are due to an inherited genetic defect that can trigger cancer. The most common types of cancer that can be genetically transmitted include breast, colorectal, gynecologic and endocrine cancers. ${ }^{21}$ For example, mutations in the genes BRCA1 and BRCA2 cause $75 \%$ more risk of breast cancer and ovarian cancer. ${ }^{22}$ Hormones are also an important endogenous factor in human cancer. The available epidemiological evidence suggests a hormonal role in the pathogenesis of testis, thyroid and breast cancer.

[^1]
### 1.1.3. Caracteristics of tumor cells

The cancer pathology is triggered by qualitative or quantitative gene modification. Three types of genes are associated to cancer pathologies:

- Oncogenes: They are positive regulators of cell proliferation. When excessively expressed, they trigger tissue proliferation, forming a tumor (Figure 1). There are about 100 different known oncogenes.

Figure 1. Oncogene formation ${ }^{23}$

- Tumor suppressor genes: They are negative cell regulators that inhibit cell proliferation. If those genes are inactivated, cell proliferation occurs. Inactivation of the tumor suppressor gene p53 greatly increases the risk of several types of cancers. p53 gene involvement in tumors is more frequent than any other known tumor suppressor or dominant proto-oncogene. ${ }^{19}$
- DNA repair genes: They detect and repair DNA lesions. Inactivation of these genes results in more DNA abnormality and a higher risk of develloping cancer.

Cancer is a multigenic pathology. Each cancer is triggered by the alteration of about 10-20 genes. These alterations occur in a succesive way, each one favouring the apparition of the next one. What happens is a chronology of alteration. At some point a healthy cell gets a non detected genetic damage that favours its uncontrolled replication. This geneticaly modified cell

[^2]has a selective advantage and a higher risk to contract other gene modifications. Thus, there is an accumulation of growth favouring gene mutations that lead to a highly cancerigenic cell (Figure 2).

Figure 2. Chronology of alteration of normal cells

Finally, The tissue looses its life and death balance system. Due to inactivation of the tumor suppressor and DNA repair genes, the cancerigenic cells don't die of apoptosis, don't repare their DNA and begin to proliferate. Then, depending on the environment, the tumor can evolve or stop growing. If the environment is not favorable, the tumor doesn't receive anymore nutrients or blood vessels to grow. If the environment is cooperative, the tumor receives what it needs to grow. It stimulates blood vessel formations by angiogenesis, links itself to the bloodstream and become invasive by metastasis (Figure 3 and 4). Depending on the type of cancer, some specific genes are altered and others not. ${ }^{24,25}$

[^3]
## Cooperative

environment

Figure 3. Cancer cells caracteristics

Figure 4. Metastasis of a malignous tumor

### 1.2. Impact and prevalence

In 2008, 12.7 million cancers were diagnosed and 7.6 million people died of cancer, which is $13 \%$ of the annual death proportion. ${ }^{26}$ It is the second death cause in the developed world and the third death cause in the developing world. The most commun cancers are lung cancer,

[^4]stomach cancer, liver cancer, colorectal cancer and breast cancer. The deadliest cancers are lung cancer, colorectal cancer, breast cancer, prostate cancer and pancreatic cancer (Figure 5). ${ }^{27}$

Figure 5. Cancer occurrence and mortality in US male and female, by occurrence ${ }^{3}$

The most commun childhood cancers are leukemia (34\%), brain tumor (23\%) and lymphomas (12\%). Rate of childhood cancer has increased by $1.1 \%$ per year between 1978 and 1997 in Europe. ${ }^{28}$

### 1.3. Cancer treatment

### 1.3.1. Cancer staging

Cancer staging is the determination of the extent the cancer has spread. It is necessary to stage cancer to determine which type of treatment will receive the patient. They are 5 cancer levels from stage 0 , which is a precursor form of cancer, to stage IV, which is metastasis formation (Figure 6).

[^5]

Figure 6. The 5 different cancer stages

### 1.3.2. Surgery

Surgery is an efficient treatment for solid localized tumor from stage 0 to II. The surgeon tries to remove the entire tumor along with, in certain cases, the lymph nodes in the area. ${ }^{29}$

### 1.3.3. Radiations

Radiation therapy involves the use of a ionizing radiation to burn tumors. It is either used alone to treat cancer, or in addition to a chirurgical operation to improve its results. ${ }^{30}$

### 1.3.4. Chemotherapy

### 1.3.4.1. Antecedents

Chemotherapy is used alone or in combination to surgery. Antitumor agents are administred to the patient to chemically kill cancer cells. It is useful in a lot of different cancer types such as cancer of breast, colon, pancreas, testicles, ovaries and lung. However, the effectiveness of chemotherapy is often limited by its high toxicity due to the low selectivity of the antitumour agents to other tissues in the body. Actual chemotherapeutic agents are not selective of cancer cells. They also attack healthy cells, especially cells in the bone marrow, digestive tract, and hair follicles. This lack of selectivity in chemotherapy causes side-effects such as hair loss, nausea,

[^6]myelosuppression (decreased production of blood cells), suppression of the immune system and mucositis (inflammation of the lining of the digestive tract). In many cases, the drug effects can contribute to the ultimate cause of death. Fortunately, because cancer cells spend more time dividing than other cells, inhibiting cell division harm tumor cells much more than other cells. Another problem comes from possible tumor resistance to some chemotherapeutic agents. In fact, cancer cells having lots of different mutations, they are more likely to bear some mutated cells that develloped a resistance against some drugs. That is why new chemotherapy treatments consist in administrating a combination of different antitumor agents to lower the tumor resistance probability to the drug. ${ }^{30}$

### 1.3.4.2. New antitumor target

### 1.3.4.2.1. Introduction

Cancer represents a broad group of various diseases, all involving unregulated cell growth. Cells divide and grow uncontrollably, forming malignant tumors and invading nearby parts of the body through metastasis. Cancer chemotherapy began in 1940 with the use of nitrogen mustards and folic acid antagonists (antifolates). Many agents used in clinical therapy for the treatment of cancer
 were essentially poisons. ${ }^{31}$ Targeted therapy developed later on, but many of the principles and limitations of chemotherapy encountered by the early researchers still apply. The classic example of targeted therapy is imatinib, a small molecule which inhibits kinase enzymes (Figure 1). ${ }^{32}$ Combretastatin A-4 is a good exemple of a natural compound that possesses several mechanisms of action that can be used in cancer treatment. In general, antitumor agents cause severe side-effects that limit the dose which can be administered and hence limit their beneficial effects. Researching and studying new anticancer agents is crucial to reduce sideeffects and improve cancer chemotherapy.

[^7]
### 1.3.4.2.2. DNA Intercalants

DNA intercalant compounds do not form a covalent bond but insert and bound to DNA through electrostatic interactions. Intercalation occurs when ligands of an appropriate size and chemical nature fit themselves between pairs of DNA bases. These ligands are mostly polycyclic, aromatic, and planar. ${ }^{33}$ Examples include ellipticine and proflavine (Figure 2).

Proflavine
Ellipticine

Figure 2. DNA intercalants compounds

Most studies showed that ellipticine mode of action is based on DNA intercalation and topoisomerase II inhibition. It has been found that ellipticine metabolises through the action of cytochrome P450 into 9-hydroxyellipticine derivatives, which are responsible of its antitumour activity. ${ }^{34}$

### 1.3.4.2.3. Topoisomerase II inhibitors

Topoisomerase II, a DNA gyrase, is an enzyme that regulates DNA supercoiling during the cell cycle. It is a homodimeric protein, associated with the mitotic chromosome portion. The crystal structure of a large fragment of topoisomerase II reveals a heart-shaped dimeric protein with a large central hole. It provides a molecular model of the enzyme as an ATP-modulated clamp with two sets of jaws at opposite ends, connected by multiple points (Figure 3).

[^8]

Figure 3. Structure of yeast topoisomerase II bound to DNA ${ }^{35}$

Topoisomerase II regulates DNA topology by first binding to DNA in a reversible way and then performing a concerted strand-breaking and religation process. ${ }^{36}$ Thereby, it changes the linking number of DNA, relaxing supercoiling. ${ }^{37}$ Topoisomerase II can also repair DNA helices that are not superimposed correctly. Indeed, by cutting the DNA helix, weak interactions between nucleotides can be broken more easily. Therefore, the nucleotides can be resuperimposed at the right location. This mechanism allows mutations during cell anaphase to be prevented (Figure 4).

Figure 4. General Figure of DNA cleavage with Topoisomerase II

[^9]Topoisomerase II inhibitors have the capacity, via the formation of a ternary drug-enzyme-DNA complex, to inhibit the religation step, resulting in increased formation of lethal DNA double breaks. They stabilize an intermediate in the complex formed by DNA and topoisomerase II and thereby prevent them from separating. This prevents topoisomerase II from repairing DNA correctly and causes cell death. Etoposide and teniposide are examples of topoisomerase II inhibitors actually used in lung cancer clinical chemotherapy (Figure 5).

Etoposide

Teniposide

Figure 5. Etoposide and teniposide topoisomerase II inhibitors ${ }^{38}$

### 1.3.4.2.4. Apoptosis promoters

Apoptosis is the process of programmed cell death that occurs in multicellular organisms. Apoptosis promoters are pro-apoptotic compounds involved in imitating apoptosis. ${ }^{39}$ Combretastatin A4 is one of the most potent apoptosis promoter which binds to tubulin and targets existing tumor blood vessels (Figure 6).

Figure 6. Combretastatin A4

Combretastatin A4 also inhibits cell tubulin polymerization at what is called the colchicine site. Microtubules are essential to cytoskeleton production, intercellular movement, cell movement, and mitotic spindle formation used in chromosome segregation and cellular division.

[^10]Endothelial cells treated with combretastatin A4 rapidly result in necrosis of the tumor core. ${ }^{40}$ The BCL-2-associated death promoter is encoded by the BCL-2 gene. ${ }^{41}$

### 1.3.4.2.5. Inhibitors of Cyclin Dependant Kinases (CDKs)

CDKs are enzymes that, once activated by cyclins, catalyse the phosphorylation of proteins in the cell cycle. These enzymes are responsible of the cell cycle checkpoints. There are four checkpoints and one restriction point, each serving as a biological hurdle to prevent any DNA damage incurred at a specific phase of the cell cycle from being replicated and passed onto new generations of cells. They are controlled by a serie of highly specific CDKs, which control progression first through the cell cycle phase and then on through the next checkpoint (Figure 7). ${ }^{38}$

Figure 7. Checkpoints and restriction points of CDKs in the cell cycle

The cell cycle is composed of 5 different phases:

1) The $G_{0}$ phase: It is a resting phase where the new cell leave the cycle. The $G_{1}$ restriction point allows re-entry of $\mathrm{G}_{0}$ cells into cell cycle.
2) The $G_{1}$ phase: The cell dimension increases. The $G_{1}$ checkpoint ensures that the $G_{1}$ phase has been accurately completed. If not, the $G_{1}$ checkpoint delays division or put the cell back to the $G_{0}$ phase.

[^11]3) The $S$ phase: The $S$ phase is when DNA replication takes place. The double stranded DNA molecule opens and each DNA strands serves as template for the production of the new complementary strand.
4) The $G_{2}$ phase: The cell continues to grow and gets ready for replication. The $G_{2}$ checkpoint ensures that the cell is ready for mitosis. If not, the cell cycle is stopped.
5) The $M$ phase: In this phase, the cell divides by mitosis. Mitosis is composed of 5 different phases:
a) Prophase: DNA coils into homologous chromosomes which all have two identical copies of each chromosome.
b) Metaphase: Each homologuous chromosome align in the middle of the cell. The M checkpoint ensures that chomosomes are correctly aligned. If not, cell replication is stopped.
c) Anaphase: During anaphase, chromosomes move to the opposite poles of the cell.
d) Telophase: In telophase, the last stage of mitosis, the chromosomes have reached the poles and begin to uncoil and become less condensed. Two new nuclear enveloppes begin to form around each of the two separated sets of unreplicated chromosomes.
e) Cytokinesis: The cytoplasm is divided into two daughter cells.

CDK inhibitors interrupt CDK phosphorylation catalysis and stop cell replication. Among the numerous existing CDKs, CDK-1, CDK-2, CDK-4, CDK-6 and CDK-9 play a very important role on cell division. Recent studies show that CDK-4 and CDK-6 are overexpressed in tumours, which means that their inhibition would dramatically decrease tumour growth. Therefore, it is commun that biological assays look for CDK-4 and CDK-6 inhibition as a possible antitumour mechanism. CDK-4 and CDK-6 act only in late $\mathrm{G}_{1}$ phase. Examples of CDK inhibitors include flavopyridol and roscovitine (Figure 8). ${ }^{42}$

[^12]

Flavopyridol

Roscovitine

Figure 8. Flavopyridol and roscovitine CDK-9 inhibitors

### 1.3.4.2.6. Pharnesyl-transferase inhibitors

Pharnesyl-transferase inhibitors inhibit the pharnesyl-transferase enzyme responsible of the KRas protein binding to the cell membrane. The K-Ras protein (or Ras protein) is an oncoprotein that, once activated, is a positive regulator of cell proliferation. The K-ras protein is activated with the action of the GEFs (GDP/GTP exchange factors) that phosphorylate a particular guanosine diphosphate into a guanosine triphosphate. Conversely, the K-ras protein inactivation is triggered by the GAP (GTPase activating protein). In healthy cells, these activation/inactivation proceses act as cell proliferation regulators. However, in $30 \%$ of human tumors, an inactivation of the GAP is observed, maintaining the K-Ras protein in its activated state. In order to be active the K-Ras protein has to previously bind to the cell membrane with the action of the pharnesyl-transferase. Inhibiting the pharnesyl-transferase enzyme results in the inactivation of the K-Ras protein which stops the uncontrolled cell proliferation (Figure 9). ${ }^{43,}$ 44

[^13]

Figure 9. Mechanism of action of pharnesyl-transferase inhibitors

Examples include tipifamib (R115777), a farnesyl-transferase inhibitor that entered phase III clinical trials (Figure 10). ${ }^{45}$

Figure 10. Tipifamib structure

### 1.3.4.2.7. Anti-angiogenic agents

Pathological events such as solid tumor growth, metastasis and other nonmalignant diseases such as arthritis, psoriasis or molecular degeneration have been found to be related to the angiogenesis process. Anti-angiogenic agents target the processes that lead to new blood vessels formation in tumours. When solid cancer tumors are small, they are supplied with

[^14]nutrients by diffusion from nearby blood vessels. In order to grow larger, they need their own blood vessels, which they create by angiogenesis promoters (Figure 11). ${ }^{46}$

Figure 11. Mechanism of angiogenesis

Examples of angiogenesis promoters include Fibroblast Growth Factor (FGF), Epidermal Growth Factor (EGF), Platelet-Derived Growth Factor (PDGF) and Vascular Endothelial Growth Factor (VEGF). ${ }^{46}$ VEGF's normal function is to create new blood vessels after injury, during embryonic development or in muscles after doing exercise, and to bypass blocked vessels. The most important member is VEGF-A. Other members are Placenta growth factor (PGF), VEGF-B, VEGFC and VEGF-D. Solid cancers cannot grow beyond a limited size without an adequate blood supply. Cancers that can express VEGF are able to grow and metastasize. Drugs that interrupt that process show promise in treating cancer. ${ }^{47}$ Anti-VEGF therapies are important in the treatment of certain cancers. Examples of monoclonal antibodies are bevacizumab (Avastin®) and antibody derivatives such as ranibizumab (Lucentis®), that both inhibit VEGF-A (Figure 12). ${ }^{48}$

[^15]

Figure 12. Angiogenesis growth factors and anti-VEGF agents

Other examples of anti-angiogenic agents include sorafenib, sunitinib and thalidomide (Figure 13). ${ }^{49,50}$

Thalidomide

Figure 13. Sorafenib, sunitinib and thalidomide anti-angiogen

[^16]2. Objectives

### 2.1. Synthesis of new topoisomerase II inhibitors

DNA topoisomerases are nuclear enzymes that make transient strand breaks in DNA to allow a cell to manipulate its topology. In agreement with precedents of our research group our aim consists in the synthesis of new topoisomerase II inhibitors possessing a dioxino-isoquinoline nucleus in its general structure (Figure 14). These compounds must not be planar to possess non intercalating DNA properties, and show

Figure 14. General dioxinoisoquinoline structure great affinity for the topoisomerase II. These compounds are of particular interest since they have been reported to selectively target pulmonary cells and to have strong inhibitory properties on topoisomerase II with an $\mathrm{IC}_{50}$ of only $0.2 \mu \mathrm{~m}$ for the tetrahydroisoquinoline 1 in human $\mathrm{NCl}-\mathrm{H} 460$ cell line (Figure 15). ${ }^{51,52}$

$\mathrm{IC}_{50}=0.2 \mu \mathrm{M} 72 \mathrm{~h}$

$\mathrm{IC}_{50}>10 \mu \mathrm{M} 72 \mathrm{~h}$

$\mathrm{IC}_{50}=21,1 \mu \mathrm{M} 72 \mathrm{~h}$

Figure 15. $\mathrm{IC}_{50}$ of compounds 1-3

These values show that a polar group on the side chain bounded to the isoquinoline nitrogen atom improves the $\mathrm{IC}_{50}$ significantly. Therefore, a new investigation is needed to change the side chain on the nitrogen atom (Scheme 1 and 2).

Scheme 1. Alkylation of the dioxinoisoquinoline 3

[^17]

Scheme 2. $N$-arylation of the dioxinoisoquinoline $\mathbf{3}$ in cross coupling condition

The chain that fits best in the complex active site of the DNA topoisomerase complex will have the best $\mathrm{IC}_{50}$ value. To obtain novel compounds and to carry out a structure activity relationship study (SAR), we were interested in developing a ready access to 1 and analogous compounds. We were also interested in changing the 1,4-benzodioxan nucleus by a dimethoxyphenyl group in order to determine the influence of this modification in its biological activity (Figure 16).

Figure 16. The dimethoxy-isoquinoline analogues 10 and 11

The difference of antitumor activity between $\mathbf{1}$ and $\mathbf{1 0}$ should assess the importance of the 1,4-benzodioxan subunit compared to the dimethoxyphenyl nucleus.

### 2.2. Synthesis of combretastatin A-4 derivatives

Combretastatin A-4 is a natural product known for its strong anticancerigenic activity attributable to different mechanisms of action. Combretastatin A-4 was isolated from the tree Combretum caffrum, in South Africa (Figure 17). ${ }^{53}$ This polymethoxylated stilbene strongly inhibits

Figure 17. Combretastatin A-4 tubulin polymerization and also shows anti-angiogenic effects. It has been shown to be a cytotoxic agent against a wide variety of tumor cells, including multidrug-resistant tumors. ${ }^{54}$ The work presented here describes new combretastatin A-4 analogues which contain a disubstituted cyclopropane, an oxirane or a 5-6 atom cycle instead of its central double bond (Figure 18).

12. $\mathrm{X}=\mathrm{CH}_{2}$
13. $X=O$

14. $R=B n$
15. $R=H$

16. $R=B n$
17. $R=H$

Figure 18. New combretastatin A-4 analogues

Replacing the central double bond with a cycle causes a change in the molecule bond angles. This implies that there are changes in the interactions between the compound and the site of action that can lead to an improved activity or a different mechanism of action. In all cases in order to mimic the double bound, the ( $Z$ ) configuration is required. Indeed, it has been reported that the (Z)-combretastatin A-4 has nanomolar activity on tubulin polymerization inhibition (TPI), whereas the (E) isomer have lower cytotoxic activity. ${ }^{55}$

Subsequently, we took an interest in the preparation of combretastatin A-4 analogues which contain a sulfonyl group instead of the trimethoxy moiety (Figure 19).

[^18]

Figure 19. New sulfonyl combretastatin A-4 analogues

Determination of the activity of these sulfonyl combretastatin derivatives and comparing them with the trimethoxy combretastatin compounds should allow us to assess the importance of the sulfoxyde and trimethoxy group in the antitumor activity of 18, 19 and 20. Moreover, the SAR study of those compounds should give us information on whether electron withdrawing groups in the aromatic ring give a better or lower activity than electron donor groups.

### 2.3. Synthesis of 1,4-benzodioxan derivatives

Benzodioxan derivatives are new cytotoxic agents derived from [1,4]-benzodioxan previously described by Dr S. Capilla and Dr M. T. Vázquez. ${ }^{56,57}$ These compounds were reported to have a micromolar antitumor activity against several cell lines, and are of great interest (Scheme 3).

Scheme 3. Previous work in 1,4-benzodioxan derivatives synthesis

[^19]Tetracyclic fused heterocyclic systems represent a series of compounds of considerable medicinal importance. ${ }^{58}$ The research work of $\operatorname{Dr}$. Capilla and $\operatorname{Dr}$ M. T. Vázquez showed that benzodioxan derivatives with a mobile side chain that bears an aromatic carbamate substituent were particularly active (Figure 20).

Figure 20. General structure of the desired dioxancarbazole derivatives
The work presented in this section reports the synthesis of fused dioxancarbazole compounds. A practical and efficient synthesis of dioxancarbazoles 21 and 22 was achieved (Figure 21).

Figure 21. Dioxancarbazoles 21 and 22

The carbamate aromatic substituents were inspired of known agents like sorafenib (Nexavar® Bayer) and potent antitumor agents synthesized in the doctoral thesis of Dr N. Mur Blanch. ${ }^{59}$

[^20]
### 2.4. Synthesis of resveratrol derivatives

Pharmaceutical studies suggested that the polyphenol resveratrol ( 3,4 ',5-trihydroxy-trans-stilbene) is one of the main wine grape components that protect from vascular and neurodegenerative diseases and cancers due to antioxidant properties (Figure 22). ${ }^{60,61}$ The ability of resveratrol to

Figure 22. Resveratrol prevent the occurrence of carcinomas was related to the inhibition of tumor cell cycle and induction of tumor cell death. ${ }^{62,63}$ We focused on the synthesis of new structural resveratrol analogues replacing the central double bond by an unsaturated ring. This modification should allow us to assess the importance of this double bond in the antitumor activity of those products (Scheme 4).

$$

[^21]3. Results and discussion

### 3.1. Introduction

Heterocyclic nuclei rings containing at least one atom of an element other than carbon are present as a subunit in an array of drug categories such as antitumor agents, antimicrobials, analgesics, antidepressants, etc. Heterocycles form by far the largest of classical divisions of organic chemistry and are of high importance biologically and industrially. ${ }^{64}$ The majority of drugs with biologically active compounds are heterocyclic. For more than a century heterocycles have constituted one of the largest area of research in organic chemistry. Heterocyclic chemistry also contributed to the understanding of life processes, because the side groups of the most typical and essential constituents of living cells, DNA and RNA, are based on aromatic heterocycles. Between the heterocyclic compounds, those containing nitrogen, sulfur and oxygen have maintained the interest of researchers. ${ }^{65}$ Our society is dependent of synthetic heterocycles such as drugs, plastics, pesticides or compounds related to nutrition.

### 3.2. Synthesis of new topoisomerase II inhibitors

### 3.2.1. Synthesis of dioxinoisoquinoline derivatives

### 3.2.1.1. Retrosynthetic analysis

Previous syntheses of the dioxinoisoquinoline 1 realized by our research group used 2,3-dihydro-[1,4]-benzodioxan 27 as starting material. ${ }^{52}$ Isoquinoline 1 can be prepared by alkylation of the dioxinoisoquinoline 3, which would be obtained by cyclization of the phenethylamine 28 with 3,4,5-trimethoxybenzaldehyde (29). The phenethylamine 28 could be synthesized from 2,3-dihydro-1,4-benzodioxin 27 under three different conditions (Scheme 5).

[^22]

Scheme 5. Retrosynthetic analysis of $\mathbf{1}$ starting from 2,3-dihydro-[1,4]-benzodioxin 27

In this work, a large quantity of $\mathbf{3}$ was synthesized, and different functionalized chains were fixed at the $N$-atom. In this way, new methods to improve previous yields and reduce the number of steps of the synthesis of $\mathbf{3}$ and $\mathbf{2 8}$ were developed.

### 3.2.1.2. Preparation of the arylethylamine 28

In our search for a good methodology to the preparation of the arylethylamine 28, four methods were investigated, one of which was already developed by our research group ( $1^{\text {st }}$ method). ${ }^{52}$ This synthetic route offers three attractive alternatives such as the formylation of the 2,3-dihydro-[1,4]-benzodioxin followed by condensation with nitromethane under Henry reaction conditions or a Friedel-Crafts acylation of the dioxygenated heterocycle and its reduction (Scheme 6).

Scheme 6. Synthesis of the amine 28

## $1^{\text {st }}$ Method

Following the procedure designed by our research group, 2,3-dihydro-[1,4]benzodioxin (27) was brominated with NBS to give 6-bromo-2,3-dihydro-[1,4]benzodioxin (37), which reacted with DMF after metal-halogen interchange using BuLi to afford 2,3-dihydro-[1,4]-benzodioxin-6-carbaldehyde (30) in appreciable yield. Treatment of nitromethane with LDA and addition to the aldehyde $\mathbf{3 0}$ under Henry reaction conditions gave the nitroalcohol 31 in low yield, which was reduced by catalytic hydrogenation with $\mathrm{H}_{2}$ and $10 \%$ palladium on carbon to afford the arylethylamine $\mathbf{2 8}$ in appreciable yield. The amine $\mathbf{2 8}$ was identical in all respects with that previously reported (Scheme 7). ${ }^{19}$

Scheme 7. Reagents and conditions: a) NBS (1 eq), MeOH ( 30 mL ), rt, $16 \mathrm{~h}, 97 \%$. b) 1) BuLi ( 1.5 eq ), THF, rt, 1 h. 2) DMF, rt, 16 h, $60 \%$. c) $\mathrm{CH}_{3} \mathrm{NO}_{2}(1.5 \mathrm{eq})$, LDA ( 1.5 eq ), THF ( 10 mL ), rt, $6 \mathrm{~h}, 20 \%$. d) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}(10 \%$ $\mathrm{m} / \mathrm{m}), \mathrm{MeOH}(50 \mathrm{~mL}), \mathrm{HCl}(30 \mu \mathrm{~L}), \mathrm{rt}, 32 \mathrm{~h}, 55 \%$.

The overall yield of this synthetic route was $7 \%$, which is comparable with the $10 \%$ overall yield described in the literature by our research group. ${ }^{19}$

## $2^{\text {nd }}$ Method

The second method implies a Friedel-Crafts acylation reaction of 2,3-dihydro-[1,4]benzodioxin (27) with ethyl oxalyl chloride to afford $\mathbf{3 2}$ in quantitative yield. Treatment of 32 with an excess of benzylamine in a nucleophilic substitution led to reaction in both the ester and the ketone electrophilic group to form 38 instead of 33 in high yield (Scheme 8).

Scheme 8. Reagents and conditions: a) Ethyl oxalyl chloride ( 1.1 eq ), $\mathrm{TiCl}_{4}(1 \mathrm{~mL}), \mathrm{DCM}(20 \mathrm{~mL}), \mathrm{rt}, 3 \mathrm{~h}$, quant. b) $\mathrm{BnNH}_{2}(2 \mathrm{eq}), \mathrm{Et}_{3} \mathrm{~N}(2 \mathrm{eq}), \mathrm{DMF}(20 \mathrm{~mL}), 90^{\circ} \mathrm{C}, 32 \mathrm{~h}, 38,95 \%$.

Other reaction conditions using less than 2 eq of benzylamine led to reaction on the ketone group first and then reaction on the ester group. This reactivity can be explained by the presence of the aromatic group in alpha of the ketone that favours the ketone amination. Attempts to hydrolyze the imine with HCl 5 N led to the hydrolysis of the amide into the carboxylic acid. A possible solution would be to previously protect the ketone, but it would increase significantly the number of steps of this synthesis in comparison with the other reported routes.

## $3^{\text {th }}$ Method

The third method consists in a Friedel-Crafts acylation reaction of 2,3-dihydro-[1,4]benzodioxin (27) with ethyl oxalyl chloride, followed by a double reduction of the ester 32 with $\mathrm{LiAlH}_{4}$ to form 34 in good yield. The hydroxyl group of 34 was converted to a good leaving group by treatment with $\mathrm{SOCl}_{2}$, and a nucleophilic substitution with benzylamine afforded the secondary amine 35 in appreciable yield. Finally, a catalytic debenzylation of 35 in the presence of $\mathrm{Pd} / \mathrm{C}$ under hydrogen atmosphere in acidic conditions led to the primary amine $\mathbf{2 8}$ in moderate yield (Scheme 9).

Scheme 9. Reagents and conditions: a) Ethyl oxalyl chloride ( 1.1 eq ), $\mathrm{TiCl}_{4}(1 \mathrm{~mL}), \mathrm{DCM}(20 \mathrm{~mL}), \mathrm{rt}, 3 \mathrm{~h}$, $98 \%$. b) $\mathrm{LiAlH}_{4}(4 \mathrm{eq})$, $\mathrm{THF}, 4 \mathrm{~h}, 76 \%$. c) $\mathrm{SOCl}_{2}\left(1.66 \mathrm{~mL}\right.$ ), toluene ( 5 mL ), $110{ }^{\circ} \mathrm{C}, 77 \%$. d) $\mathrm{BnNH}_{2}(1.5 \mathrm{eq})$, $\mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq}), \mathrm{DMF}(20 \mathrm{~mL}), 9{ }^{\circ} \mathrm{C}, 32 \mathrm{~h}, 66 \%$. e) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}(20 \% \mathrm{~m} / \mathrm{m}), \mathrm{MeOH}(3 \mathrm{~mL}), \mathrm{HCl}(30 \mu \mathrm{l})$, EtOAc (20 mL ), rt, $32 \mathrm{~h}, 53 \%$.

The overall yield of this 5 -step alternative route was $20 \%$, which was higher than the first method.

## $4^{\text {st }}$ Method

In this fourth method, the aldehyde 30 reacted with nitromethane and ammonium acetate according to the literature procedure to afford 36 in excellent yield. ${ }^{66}$ Reduction of the nitroethene $\mathbf{3 6}$ under hydrogen pressure in the presence of $\mathrm{Pd} / \mathrm{C}$ led mostly to the vinyl amine and only traces of the amine 28. A high pressure hydrogenation of $\mathbf{3 6}$ (6-8 atm) with Pd/C slightly improved the reaction to afford $\mathbf{2 8}$ in low yield. Finally, the reduction of $\mathbf{3 6}$ with $\mathrm{LiAlH}_{4}$ under classical conditions afforded the amine $\mathbf{2 8}$ in acceptable yield (Scheme 10).

Scheme 10. Reagents and conditions: a) $\mathrm{CH}_{3} \mathrm{NO}_{2}(10 \mathrm{~mL}), \mathrm{CH}_{3} \mathrm{COONH}_{4}(3.5 \mathrm{eq}), 100^{\circ} \mathrm{C}, 2 \mathrm{~h}, 90 \%$. b) $\mathrm{Pd} / \mathrm{C}$ $(10 \% \mathrm{~m} / \mathrm{m}), \mathrm{H}_{2}(7 \mathrm{~atm}), \mathrm{MeOH} / E t O A c ~ 1: 3,16 \mathrm{~h}, 24 \%$. c) $\mathrm{LiAlH}_{4}(4 \mathrm{eq}), \mathrm{THF}, \mathrm{rt}, 16 \mathrm{~h}, 58 \%$.

In order to optimize the preparation of 2,3-dihydro-[1,4]-benzodioxin-6-carbaldehyde (30), the commercially available 3,4-dihydroxybenzaldehyde (40) was alkylated with 1,2-dibromoethane and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetone yielding $\mathbf{3 0}$ in $42 \%$ yield. When the solvent was substituted by DMF the desired aldehyde $\mathbf{3 0}$ was obtained in $81 \%$ yield (Scheme 11). ${ }^{67}$ DMF was chosen to afford a higher reaction temperature.

Scheme 11. Reagents and conditions: a) 1,2-dibromoethane (1.2 eq), $\mathrm{K}_{2} \mathrm{CO}_{3}(5 \mathrm{eq})$, acetone, $56{ }^{\circ} \mathrm{C}, 16 \mathrm{~h}$, $42 \%$. b) 1,2-dibromoethane ( 1.2 eq ), $\mathrm{K}_{2} \mathrm{CO}_{3}(5 \mathrm{eq})$, DMF, $120^{\circ} \mathrm{C}, 16 \mathrm{~h}, 81 \%$.

On the basis of the results obtained, the best reaction conditions to yield the amine $\mathbf{2 8}$ were depicted on scheme 12. The 3-steps are: a) alkylation, b) condensation of the

[^23]arylaldehyde 29 with nitromethane and c) reduction of the nitroolefin 36 to the arylethylamine 28.

Scheme 12. Best reaction conditions to yield the arylethylamine 28. Reagents and conditions: a) 1,2dibromoethane ( 1.2 eq ), $\mathrm{K}_{2} \mathrm{CO}_{3}(5 \mathrm{eq})$, $\mathrm{DMF}, 120^{\circ} \mathrm{C}, 16 \mathrm{~h}, 81 \%$. b) $\mathrm{CH}_{3} \mathrm{NO}_{2}(10 \mathrm{~mL}), \mathrm{CH}_{3} \mathrm{COONH}_{4}(3.5 \mathrm{eq})$, $100^{\circ} \mathrm{C}, 2 \mathrm{~h}, 90 \%$. c) $\mathrm{LiAlH}_{4}(4 \mathrm{eq})$, THF, rt, $16 \mathrm{~h}, 58 \%$.

The overall yield of this 3 -steps reaction was $42 \%$. This method is more practical and efficient than the one previously described in the literature by our research group. ${ }^{19}$ The overall yield of the synthesis of $\mathbf{2 8}$ was improved by $32 \%$. The arylethylamine $\mathbf{2 8}$ was characterized by IR, ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR.

### 3.2.1.3. Synthesis of the isoquinoline $\mathbf{3}$ from the arylethylamine 28

Recognizing the medical value of nitrogen-containing heterocyclic compounds, scientists continue to devise new compounds and novel methods for their preparation. ${ }^{68}$ The dioxinoisoquinoline $\mathbf{3}$ is a tricyclic heterocycle which can be used as scaffold in medicinal chemistry. Common syntheses of substitued isoquinolines involve traditional routes such as the Bischler-Napieralski reaction, an intramolecular electrophilic aromatic substitution reaction that allows the cyclisation of arylethylamides. This reaction involves a dichlorophorphoryl imine-ester intermediate (amide $+\mathrm{POCl}_{3}$ ) (Scheme 13). ${ }^{69}$

[^24]

Scheme 13. Bischler-Napieralski mechanism.

An alternative mechanism considers the formation of the nitrilium ion after elimination and before cyclization. Different reaction conditions favor one or another mechanism (Scheme 14).

Scheme 14. Alternative Bischler-Napieralski mechanism

Previous work described by Dr. Sergi Capilla Mies and Dr. Manel Romero Balaguer showed that classical Bishler-Napieralski reactions were ineffective for cyclization of 1,4-benzodioxanethylamine structures. ${ }^{70}$ Following the previous work methodology of our research group, a number of attempts were carried out for the preparation of the tetrahydroisoquinolines 3 and its optimization. ${ }^{19}$ Amination of 3,4,5trimetoxibenzaldehyde (29) with the arylethylamine $\mathbf{2 8}$ using PTSA or CSA in toluene

[^25]did not yield the corresponding isoquinoline due to solubility problems. However, amination of $\mathbf{2 9}$ with $\mathbf{2 8}$ in EtOH at pH 6 in presence of molecular sieves $4 \AA$ A , followed by an intramolecular cyclization reaction of the resulting imine with TFA and TFAA gave the intermediate 2 in $14 \%$ yield, which was hydrolysed with NaOH 2 N to afford the dioxine-isoquinoline 3 in $98 \%$ yield (Table 1). Replacing HCl by an acid resin did not improve the reaction.

Table 1. Formation of the dioxine-isoquinoline 3

| Entry | a) | b) | Results |
| :---: | :---: | :---: | :---: |
| 1. | toluene, CSA, Dean Stark, 16 h, reflux | TFA, TFAA, rt, 72 h | Low solubility |
| 2. | EtOH, $\mathrm{HCl}(\mathrm{pH} 6)$, molecular sieves 4 A, <br> 16 h, reflux | TFA, TFAA, reflux, 16 h | $\mathbf{2 ( 1 4 \% )}$ |
| 3. | EtOH, amberlyst® 15 ion-exchange <br> resin, 72 h, reflux | TFA, TFAA, reflux, 48 h | No reaction |

Another method was tried to improve the yield of 3 . Amination of the $3,4,5-$ trimetoxibenzaldehyde 29 with the arylethylamine 28 in a Dean Stark apparatus, followed by addition of $\mathrm{H}_{3} \mathrm{PO}_{4}$ ( $85 \%$ of an aqueous solution) afforded the isoquinoline 3 in 32\% yield (Scheme 15).

Scheme 15. Synthesis of the dioxinisoquinoline 3 using $\mathrm{H}_{3} \mathrm{PO}_{4}$. Reagents and conditions: a) 3,4,5trimetoxybenzaldehyde (1.1 eq), benzene, Dean-Stark, $110^{\circ} \mathrm{C}, 3 \mathrm{~h}$. b) $\mathrm{H}_{3} \mathrm{PO}_{4}(2 \mathrm{~mL}$ of a $85 \%$ aqueous solution), Dean-Stark, $110^{\circ} \mathrm{C}, 4 \mathrm{~h}, 32 \%$ yield.

A possible mechanism for this intramolecular ciclyzation process implies protonation of the aldehyde, addition of the amine to the carbonyl group, dehydration and cyclization as indicated in Scheme 16.

Scheme 16. $\mathrm{H}_{3} \mathrm{PO}_{4}$ mediated cyclization mechanism

The yield was improved by $18 \%$ compared to the previous method.

### 3.2.1.4. Alkylation of benzodioxanisoquinoline 3

In the present study and as a continuation of the synthesis of dioxanisoquinoline analogues, the isoquinoline $\mathbf{3}$ was involved in an alkylation process using classical conditions. In a general procedure, $\mathbf{3}$ is treated with the corresponding alkyle halide, $\mathrm{Et}_{3} \mathrm{~N}$ or $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{KI}$ and DMF obtaining the desired compound in low to satisfactory yields (Scheme 17).

Scheme 17. General alkylation procedure of the tetrahydroisoquinoline 3.

The results of a number of alkylation attempts of $\mathbf{3}$ carried out at both $80^{\circ} \mathrm{C}$ and room temperature revealed that the alkylation reaction provided better yields when performed at room temperature despite of an increased reaction time. Indeed, alkylation of 3 at $80{ }^{\circ} \mathrm{C}$ were faster but favoured the oxidation of the tetrahydroisoquinoline 3 to the isoquinoline by-product 43 (Scheme 18).

Scheme 18. Oxidation of $\mathbf{3}$ at $80^{\circ} \mathrm{C}$ forming the by-products 41,42 and 43

### 3.2.1.5. Synthesis of compound 1 and 6

The tetrahydroisoquinoline $\mathbf{3}$ was alkylated with 2-chloroethanol under classical conditions in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ and KI providing the alcohol 1 in $32 \%$ yield after purification (Scheme 19).

Scheme 19. Reagents and conditions: a) 2-chloroethanol ( 40 eq over 10 days), $\mathrm{Et}_{3} \mathrm{~N}(8 \mathrm{eq}$ ), $\mathrm{KI}(0,1 \mathrm{eq}), \mathrm{rt}$, DMF, 7 days, $32 \%$.

The tetrahydroisoquinoline $\mathbf{3}$ was involved in an N -alkylation reaction under the same reaction conditions as indicated above with 2-dimethylaminoethyl chloride, $\mathrm{Et}_{3} \mathrm{~N}$ and KI to afford 6 in $8 \%$ yield and recuperation of the starting material (Scheme 20). The low yield obtained was attributed to the low solubility of the 2-dimethylaminoethyl chloride in DMF.

Scheme 20. Synthesis of amine 6. Reagents and conditions: a) 2-dimethylaminoethyl chloride (15 eq over 5 days), $\mathrm{Et}_{3} \mathrm{~N}(8 \mathrm{eq})$, $\mathrm{KI}(0,1 \mathrm{eq})$, rt, 7 days, 6 ( $8 \%$ ), 3 ( $83 \%$ ).

### 3.2.1.6. Synthesis of the tetrahydroisoquinolines 4 and 5

An alkylation reaction of $\mathbf{3}$ using chloroacetonitrile and the conditions described above led to 4 in a satisfactory yield of $78 \%$ due to the high reactivity of the $\mathrm{CH}_{2}$ group of the chloroacetonitrile in comparison with the low reactivity of other alkyl halides. The nitrile group of 4 was reduced with $\mathrm{LiAlH}_{4}$ to yield 5 in acceptable yield (Scheme 21).

Scheme 21. Reagents and conditions: a) chloroacetonitrile (3 eq), $\mathrm{KI}(0.3 \mathrm{eq}), \mathrm{K}_{2} \mathrm{CO}_{3}(5 \mathrm{eq})$, DMF, $\mathrm{rt}, 10$ days, $78 \%$. b) $\mathrm{LiAlH}_{4}$ (3 eq), THF, $3 \mathrm{~h}, 52 \%$.

### 3.2.1.7. Synthesis of 7 and 44

The acetal 7 was synthesized by $N$-alkylation of $\mathbf{3}$ with the corresponding alkyl halide in low yield. Hydrolysis of the acetal 7 with HCl 2 N was not successful due to decomposition of 7 into the tetrahydroisoquinoline $\mathbf{3}$ and its oxidized derivatives 41, 42 and 43. A second hydrolysis attempt at rt with HCl 2 N and isopropanol did not improve the reaction. A third hydrolysis attempt with an acidic resin instead of HCl afforded starting material only (Scheme 22).

Scheme 22. Synthesis attempt of aldehyde 44. Reagents and conditions: a) 3Chloropropionaldehydediethylacetal ( 7.5 eq ), $\mathrm{Et}_{3} \mathrm{~N}(4 \mathrm{eq}), \mathrm{KI}(0,1 \mathrm{eq}), \mathrm{DMF}, 5$ days, $15 \%$. b) $\mathrm{HCl}(8 \mathrm{~mL}$ of a 2 N aqueous solution), $\mathrm{EtOH}, \mathrm{rt}, 16 \mathrm{~h}$, decomposition of 7 to $\mathbf{3}$. C) $\mathrm{HCl}(8 \mathrm{~mL}$ of a 2 N aqueous solution), isopropanol, $\mathrm{rt}, 16 \mathrm{~h}$, no reaction. d) acidic resin (1 eq), $\mathrm{EtOH}, 16 \mathrm{~h}$, no reaction.

### 3.2.1.8. Synthesis attempt of 46 and 47

Firstly, the acylation of the tetrahydroisoquinoline $\mathbf{3}$ with ethyl chloroformate and $\mathrm{Et}_{3} \mathrm{~N}$ led to the carbamate 45 in satisfactory yield. Nucleophilic substitution of the ester 45 with piperazine, HOBt and $\mathrm{Et}_{3} \mathrm{~N}$ in DCM at rt afforded starting material only. Replacing DCM by DMF and heating at $120^{\circ} \mathrm{C}$ for 16 h did not improve the reaction. According to these results, an acylation reaction of $\mathbf{3}$ with 1-methylpiperazine instead of piperazine was attempted in the same conditions as before but starting material only was recovered. Replacing THF by DMF and heating to $100^{\circ} \mathrm{C}$ for 16 h did not improve the reaction. An attempt to prepare the urea 47 from the amine $\mathbf{3}$ and ethyl-4-methyl-1piperazinecarboxylate was carried out in presence of DMP at reflux of THF for 16 h , but only starting material was afforded (Scheme 23).

Scheme 23. Synthesis attempts of urees 46 and 47. Reagents and conditions: a) ethyl chloroformate (1.5 eq), $\mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq}), \mathrm{DCM}, \mathrm{rt}, 3 \mathrm{~h}, 53 \%$. b) Piperazine ( 3 eq ), $\mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq})$, HOBt ( 1.5 eq ), DCM, reflux, 16 h , no reaction. c) Piperazine ( 3 eq ), $\mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq})$, $\mathrm{HOBt}(1.5 \mathrm{eq})$, DMF, reflux, 16 h , no reaction. d) 1Methylpiperazine ( 3 eq ), $\mathrm{Et}_{3} \mathrm{~N}$ ( 1.5 eq ), $\mathrm{HOBt}(1.5 \mathrm{eq})$, THF, reflux, 16 h , no reaction. e) 1Methylpiperazine (3 eq), Et3N (1.5 eq), HOBt ( 1.5 eq ), DMF, reflux, $16 \mathrm{~h}, \mathrm{SM}$ only. f) 4-Ethyl 4-methylpiperazine-1-carboxylate ( 1.5 eq ), DMP ( 0.4 eq ), THF, rt, 3 days, no reaction.

On the basis of these results, we came to the conclusion that the carbamate 45 is not reactive enough to undergo nucleophilic substitutions with secondary amines under the tested conditions.

### 3.2.1.9. Synthesis of the tetrahydroisoquinolines 8 and 9

The preparation of the tetrahydroisoquinolines 8 and 9 was accomplished by N arylation of the tetrahydroisoquinoline 3, following a general procedure previously described in the literature. ${ }^{71,72}$ The tetrahydroisoquinoline 3 reacted with 1-bromo-4nitrobenzene in the presence of $\operatorname{Pd}\left[(o \text {-tolylP })_{3} \mathrm{P}_{2} \mathrm{Cl}_{2},( \pm)\right.$-BINAP and 2 equivalents of $\mathrm{Cs}_{2} \mathrm{O}_{3}$ in toluene yielding 8 in $33 \%$ yield. In the same way, the N -arylation of $\mathbf{3}$ with 4bromobenzonitrile afforded 9 in 26\% yield (Scheme 24). The low yields should be attributed to the hindrance provided by the trimethoxyphenyl substituent at the $\mathrm{C}-1$

[^26]position as well as the high temperature required for this N -arylation that favoured the formation of the aromatized isoquinoline 43.

Scheme 24. Reagents and conditions: a) 1-bromo-4-nitrobenzene (1.2 eq), $\operatorname{Pd}[(o-t o l y l))_{3} \mathrm{P}_{2} \mathrm{Cl}_{2}$ (cat), $\mathrm{Cs}_{2} \mathrm{CO}_{3}(2 \mathrm{eq})$, ( $\pm$ )-BINAP (cat), toluene, $110{ }^{\circ} \mathrm{C}, 72 \mathrm{~h}, 33 \%$ yield. b) 4-bromobenzonitrile ( 1.2 eq ), $\mathrm{Pd}[(o-$ tolyl) ${ }_{3} \mathrm{P}_{2} \mathrm{Cl}_{2}$ (cat), $\mathrm{Cs}_{2} \mathrm{CO}_{3}(2 \mathrm{eq})$, ( $\pm$ ) BINAP (cat), toluene, $110^{\circ} \mathrm{C}, 24 \mathrm{~h}, 26 \%$ yield.

Compounds 1, 4, 5, 6, 7, 8 and 9 were submitted to the Lilly Laboratories (Indianapolis, USA) for biological testing to estimate their antitumor activities and to study their mechanisms of action.

### 3.2.1.10. Synthesis attempt of 48

The $N$-arylation of the tetrahydroisoquinoline 3 with 4-bromothioanisole, $\mathrm{Pd}[(0$ tolyl $)_{3} \mathrm{P}_{2} \mathrm{Cl}_{2},( \pm)$ BINAP and $\mathrm{Cs}_{2} \mathrm{O}_{3}$ only led to the aromatized isoquinoline 43 due to the lack of reactivity of 4-bromothioanisole compared to 1-bromo-4-nitrobenzene or 1-bromo-4-cyanobenzene (Scheme 25). Indeed, N -arylation reactions are more efficient when the aromatic halogen bears an electron withdrawing group in the para position and lower or no reactivity was found with an electron donor group.

Scheme 25. Synthesis attempt of 48. Reagents and conditions: a) 1-Bromo-4-cyanobenzene (1.2 eq), $\mathrm{Pd}\left[(o \text {-tolyl })_{3} \mathrm{P}_{2} \mathrm{Cl}_{2}(\right.$ cat $), \mathrm{Cs}_{2} \mathrm{CO}_{3}(2 \mathrm{eq})$, ( $\pm$ ) BINAP (cat), toluene, $110^{\circ} \mathrm{C}, 72 \mathrm{~h}$, aromatization of $\mathbf{3}$ to 43 .

### 3.2.2. Synthesis of dimethoxy-isoquinoline analogues

### 3.2.2.1. Retrosynthetic analysis of the dimethoxy-isoquinoline 10 and 11

In order to determine if the substitution of the 1-4-dioxane nucleus by a dimethoxy group results in an increase or decrease in biological activity, two dimethoxyisoquinoline analogues were synthesized from the commercially available 2-(3,4dimethoxyphenyl)ethylamine $\mathbf{5 0}$ following the same experimental protocol used for the preparation of $\mathbf{3}$. The dimethoxy-isoquinoline $\mathbf{1 0}$ and $\mathbf{1 1}$ can be made from the dimethoxy-isoquinoline intermediate 49, which would be obtained by cyclization of the phenethylamine 50 with 3,4,5-trimethoxybenzaldehyde (29) (Scheme 26).

Scheme 26. Retrosynthetic analysis of the dimethoxy-isoquinolines 10 and 11

### 3.2.2.2. Synthesis of the isoquinoline 49 from the arylethylamine 50

3,4,5-Trimethoxybenzaldehyde (29) and 2-(3,4-dimethoxyphenyl)ethylamine (50) were coupled in an amination reaction, followed by intramolecular cyclization of the corresponding imine with TFA and TFAA to afford the amide 51 in moderate yield. The tetrahydroisoquinoline 49 was prepared from hydrolysis of 51 with NaOH 2 N in good yield (Scheme 27).

Scheme 27. Reagents and conditions: a) toluene, PTSA, Dean Stark, 16 h, reflux. b) TFA, TFAA, rt, 16 h, $33 \%$. c) $\mathrm{NaOH} 2 \mathrm{~N} / \mathrm{MeOH} 7: 3$, reflux, $16 \mathrm{~h}, 97 \%$.

### 3.1.2.3. Alkylation of the dimethoxy-isoquinoline 49

In continuation of our study of the synthesis of tetrahydroisoquinolines possessing potential cytotoxic activity, the dimethoxy-isoquinoline 49 was alkylated giving two new compounds. First, treatment of 49 with 2-bromoethanol in classical conditions led to the alcohol 10 in low yield (Scheme 28). The reaction was performed at room temperature because of the same stability problems than the amine 3.

Scheme 28. Reagents and conditions: a) 2-chloroethanol (25 eq over 7 days), $\mathrm{Et}_{3} \mathrm{~N}(8 \mathrm{eq}), \mathrm{KI}(0,1 \mathrm{eq}), \mathrm{rt}$, DMF, 10 days, $16 \%$.

Similarly, the alkylation of 49 with ( $\pm$ )-epichlorohydrin in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ and KI led to the intermediate epoxide 52 in moderate yield, which was hydrolyzed with NaOH 2 N to afford the diol 11 in moderate yield (Scheme 29).

Scheme 29. Reagents and conditions: a) ( $\pm$ )-epichlorohydrin (9 eq over 2 days), $\mathrm{Et}_{3} \mathrm{~N}(8 \mathrm{eq}), \mathrm{KI}(0,1 \mathrm{eq})$, rt, DMF, 2 days, $45 \%$. b) $\mathrm{NaOH} 2 \mathrm{~N} / 1,4$-dioxane 5:2, rt, 2 days, $48 \%$.

The alcohol 10 and the diol 11 were submitted to the Lilly Laboratories (Indianapolis, USA) for biological testing to evaluate their antitumor activities.

### 3.3. Synthesis of combretastatin A-4 derivatives

### 3.3.1. Synthesis of the carboxylic acid 53, ester 54 and olefin 55a

### 3.3.1.1. Retrosynthetic analysis

The cyclized combretastatin A-4 analogues can be prepared from the carboxylic acid 53, which would come from 3,4,5-trimethoxyphenylacetic acid 56 by condensation with 3-benzyloxy-4-methoxybenzaldehyde 57 (Scheme 30). We expected that this molecular modification reveals some detailed and structural information to predict other series of analogues.

Scheme 30. Retrosynthetic analysis of combretastatin A-4 analogues from the monocyclic compounds 56 and 57.

### 3.3.1.2. Synthesis of the carboxylic acid 53 and the ester 54

The multistep synthesis of the new combretastatin A-4 analogues required the preparation of the carboxylic acid 53 and the ester 54 as starting material. $O$ Benzylation of 3-hydroxy-4-methoxybenzaldehyde 58 with benzyl bromide provided 57 in quantitative yield. The corresponding aldehyde 57 was then coupled with 3,4,5trimetoxyphenylacetic acid (56) in a modified Perkin reaction according to the literature procedure ${ }^{73,74}$ to form the trans carboxylic acid $\mathbf{5 3}$ in moderate yield. Only the trans isomer 53 was isolated, while no sign of the cis isomer was detected according to the NMR data. The carboxylic acid 53 was treated with $\mathrm{CH}_{3}$ I and $\mathrm{K}_{2} \mathrm{CO}_{3}$ affording the alkyne ester 49 in quantitative yield (Scheme 31).

[^27]

56
53
54
Scheme 31. Synthesis of carboxylic acid $\mathbf{5 3}$ and alkyne ester 54. Reagents and conditions: a) $\mathrm{BnBr}(1.5$ eq), $\mathrm{K}_{2} \mathrm{CO}_{3}(1.5 \mathrm{eq}), \mathrm{DMF}, 80^{\circ} \mathrm{C}, 16 \mathrm{~h}, 94 \%$. b) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, 6 \mathrm{~h}, 140^{\circ} \mathrm{C}, 27 \%$.c) $\mathrm{CH}_{3} \mathrm{I}(2.5 \mathrm{eq}), \mathrm{K}_{2} \mathrm{CO}_{3}(2 \mathrm{eq})$, DMF, rt, 16 h, 95\%.

A mechanism of the modified Perkin reaction can be the below indicated (Scheme 32).

Scheme 32. Mechanism of the modified Perkin reaction

### 3.3.1.3. Synthesis of the olefin 55a

The carboxylic acid 53 was decarboxylated using quinoline and copper in a microwave mediated reaction to form a mixture of the cis olefin 55a in 75\% yield and the trans olefin 55b in $20 \%$ yield. Alternatively, this reaction can be performed in standard heating conditions to form $\mathbf{5 5}$ a in $\mathbf{6 0 \%}$ yield and $\mathbf{5 5 b}$ in $\mathbf{1 9 \%}$ yield (Scheme 34). 55b was converted to 55a in a photochemical isomerization reaction using benzil in $60 \%$ yield
according to the literature procedure (Scheme 33). ${ }^{75}$ This conversion was confirmed by the corresponding NMR data ( ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ spectra).

Scheme 33. Synthesis of olefin 55a. Reagents and conditions: a) Quinoline, Cu (cat), microwave oven, $230^{\circ} \mathrm{C}, 100 \mathrm{psi}, 10 \mathrm{~min}, 55 \mathrm{a} 75 \%$, 55b $21 \%$. b) Quinoline, $\mathrm{Cu}(\mathrm{cat}), 230^{\circ} \mathrm{C}, 6 \mathrm{~h}, 55 \mathrm{a} 60 \%$, 55b $22 \%$. c) Benzil ( 5 eq), benzene, 254 nm UV, 5 h, $60 \%$.

### 3.3.2. Synthesis attempts of the carbocylic acid 21, 22 and 23

### 3.3.2.1. Retrosynthetic analysis

Similarly, we took an interest in the preparation of combretastatin A-4 analogues which contain a sulfonyl group instead of the trimethoxy moiety (Scheme 34).

Scheme 34. Retrosynthetic analysis of sulfonyl combretastatin A-4 analogues from carboxylic acid $\mathbf{6 0}$ and benzaldehyde 57.

### 3.3.2.2. Synthesis of 59a from the carboxylic acid 60

A number of attempts were made to synthesize the carboxylic acid 59a from 4(methylsulfonyl)phenylacetic acid (60). Firstly, a Perkin reaction with 60, 3-benzyl-4methylbenzaldehyde 57 and $\mathrm{Et}_{3} \mathrm{~N}$ in $\mathrm{Ac}_{2} \mathrm{O}$ led to ( E ) and (Z) carboxylic acid 59a and 59b in very low yield. Starting material 60 and 57 were recovered. A Perkin reaction with DBU instead of $\mathrm{Et}_{3} \mathrm{~N}$ did not improve this condensation (Scheme 35).

[^28]

Scheme 35. Synthesis of 59. Reagents and conditions: a) $\mathrm{Et}_{3} \mathrm{~N}(2 \mathrm{eq}), \mathrm{Ac}_{2} \mathrm{O}$, reflux, $8 \mathrm{~h}, \mathbf{5 9 a}$ and $\mathbf{5 9 b}$ (5\%). b) DBU (2 eq), Ac ${ }_{2} \mathrm{O}$, reflux, $8 \mathrm{~h}, 59 \mathrm{a}$ and $\mathbf{5 9 b}$ (3\%).

The very low yield can be explained by the lack of reactivity of $\mathbf{6 0}$ due to the sulfone group which stabilizes the carbanion intermediate formed by deprotonation of the hydrogen in alpha of the carboxylic acid group.

### 3.3.2.3. Alternative synthesis attempts of the carboxylic acid 59a

On the basis of the results exposed in the previous section, an alternative route was tried to afford the carboxylic acid 59a. A Perkin reaction of 4-(methylthio)phenylacetic acid (62) with 3-benzyl-4-methylbenzaldehyde (57) followed by oxidation of the corresponding methylthiobenzene 61 would afford the methylsulfone 59a (Scheme 36).

Scheme 36. Retrosynthetic analysis of the carboxylic acid 59a A-4 from the carboxylic acid $\mathbf{6 2}$ and the aldehyde 57.

The 4-(methylthio)phenylacetic acid (62) was prepared in a 3-step synthesis starting from (methylthio)benzene (63). Acylation of 63 with mono-ethyl oxalyl chloride followed by hydrolysis of the corresponding ester (64) with NaOH led to 2-(4-(methylthiophenyl)-2-oxoacetic acid 65 in good yield. 2-(4-(Methylthiophenyl)acetic acid (62) was synthesized from 65 by a Wolff-Kishner reduction in satisfactory yield (Scheme 36).

Scheme 36. Preparation of 2-(4-(methylthiophenyl)acetic acid (61) from (methylthio)benzene (62). Reagents and conditions: a) ethyl chlorooxoacetate ( 1.1 eq ), $\mathrm{TiCl}_{4}(3.5 \mathrm{~mL}), \mathrm{DCM}, \mathrm{rt}, 16 \mathrm{~h}, 50 \%$. b) NaOH / EtOH (7:3), reflux, $16 \mathrm{~h}, 78 \%$. c) KOH ( 2.5 eq), hydrazine hydrate ( 2.3 eq), diethylene glycol, $200^{\circ} \mathrm{C}, 4 \mathrm{~h}$, 79\%.

Finally, a Perkin reaction with 4-(methylsulfonyl)phenylacetic acid (62) and 3-benzyl-4methylbenzaldehyde (57) in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ in $\mathrm{Ac}_{2} \mathrm{O}$ led to recuperation of the starting materials only (Scheme 37).

Scheme 37. Synthesis attempt of 65. Reagents and conditions: a) $\mathrm{Et}_{3} \mathrm{~N}(2 \mathrm{eq}), \mathrm{Ac}_{2} \mathrm{O}$, reflux, 8 h , starting materials only.

These results show that the Perkin reaction is difficult to perform with methylsulfones and methylthio carboxylic acids.

### 3.3.3. Cyclopropanation attempts of the olefin 55a

### 3.3.3.1. Classical synthesis attempts of the cyclopropane 66

Several attempts were made to synthesize the cyclopropane 66 from the olefin 55a using reaction conditions previously described in the literature ${ }^{76,77,78}$ (Table 2). A $\mathrm{Zn}(\mathrm{Cu})$ catalyzed cyclopropanation with $\mathrm{CH}_{2} I_{2}$ in DCM heated to reflux for 1 week recovered the starting material. A cyclopropanation reaction using trimethylsulfonium iodide and NaH in DMSO at $150^{\circ} \mathrm{C}$ for 16 h recovered only the starting material. The microwave assisted cyclopropanation of 55a according to the procedure described in

[^29]the literature did not improve the reaction. Heating at $150{ }^{\circ} \mathrm{C}$ for one week showed partial consumption of the starting material and formation of a product that was identified by mass spectrum and ${ }^{1} \mathrm{H}$ NMR data as the $\mathrm{C}-2$ iodinated compound derivative (MS (EI) $m / z=532$ ). Replacing the base NaH by $t$-BuOK or MeONa in order to allow better deprotonation of the trimethylsulfonium iodide did not improve the reaction. The trimethylsulfonium iodide used in this reaction was previously prepared from dimethylsulfoxide and $\mathrm{CH}_{3} \mathrm{l}$ as reported in the literature. ${ }^{79}$ Finally, a cyclopropanation reaction of 55a with $\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{~N}$-methyl- N -nitrosourea and NaOH was attempted according to the procedure described in the literature ${ }^{80}$ to form diazomethane in-situ. This reaction led to (E)-isomerization of 55a in a $26 \%$ yield. Starting material was also recovered.

Table 2. Reaction conditions of the cyclopropanation of olefin 15

| Entry | Reagents | Reaction conditions | Observations |
| :---: | :---: | :---: | :---: |
| 1. | $\mathrm{CH}_{2} l_{2}, \mathrm{Zn}(\mathrm{Cu}), \mathrm{CH}_{2} \mathrm{Cl}_{2}$ | Reflux, 1 week | Starting material |
| 2. | Trimethylsulfonium <br> iodide, $\mathrm{NaH}, \mathrm{DMSO}$ | $150^{\circ} \mathrm{C}, 16 \mathrm{~h}$ | Starting material |
| 3. | Trimethylsulfonium <br> iodide, $\mathrm{NaH}, \mathrm{DMSO}$ | Microwaves, $150^{\circ} \mathrm{C}, 10$ <br> $\mathrm{~min}, 60 \mathrm{psi}$ | Starting material |
| 4. | Trimethylsulfonium <br> iodide, | $80^{\circ} \mathrm{C}, 72 \mathrm{~h}$ | Starting material |
| 5. | Trimethylsulfonium <br> iodide, $\mathrm{NaH}, \mathrm{DMSO}$ | $150^{\circ} \mathrm{C}, 1$ week | Starting material and the <br> $\mathrm{C}-2$ iodinated by-product |
| 6. | $N$-methyl- N -nitrosourea, <br> $\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{KOH}$, ether | 4 h at $0^{\circ} \mathrm{C}$ and 16 h at rt | Trans-isomerization and <br> starting material only. |

[^30]
### 3.3.3.2. Alternative cyclopropanation attempts

On the basis of these results, alternative cyclopropanations were attempted according to the literature procedure. ${ }^{81}$ The use of ethyl diazoacetate catalyzed by copper did not afford the desired cyclopropane derivative 67. Ethyl diazoacetate was prepared from the commercially available glycine ethyl ester hydrochloride, $\mathrm{NaNO}_{2}$ and $\mathrm{H}_{2} \mathrm{SO}_{4}$ as reported in the literature (Scheme 38). ${ }^{82}$

Scheme 38. Copper-catalyzed olefin cyclopropanation of 55a. Reagents and conditions: a) $\mathrm{NaNO}_{2}(1.1$ eq), $\mathrm{H}_{2} \mathrm{SO}_{4}$ ( 5 mL of an aqueous solution), $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$, $\mathrm{DCM}(10 \mathrm{~mL}), \mathrm{rt}, 15 \mathrm{~min}, 82 \%$. b) Ethyl diazoacetate ( 24 eq ), $\mathrm{Fe}_{2}(\mathrm{CO})_{9}(1 \mathrm{eq})$, $\mathrm{Cul}(\mathrm{cat}), \mathrm{DCM}, \mathrm{rt}, 16 \mathrm{~h}$, inaltered starting material was recovered.

Secondly, the cyclopropanation reaction using dichlorocarbene prepared in situ, chloroform and KOH recovered starting material only. ${ }^{83}$ Using $t$-BuOK instead of KOH did not improve the reaction (Scheme 39).

Scheme 39. Cyclopropanation reaction of 55a with dichlorocarbene. Reagents and conditions: a) KOH (20 eq), $\mathrm{CHCl}_{3}(10 \mathrm{~mL})$, reflux, 3 days, starting material only. b) $t$ - $\mathrm{BuOK}(20 \mathrm{eq}), \mathrm{CHCl}_{3}(10 \mathrm{~mL})$, reflux, 3 days, inaltered starting material was recovered.

These results showed that the central double bond is not reactive enough in the conditions applied to undergo cyclopropanation reactions. In the future, this reaction

[^31]will be attempted under microwave assistance at high pressure and temperature in an attempt to force the reaction conditions.

### 3.3.4. Epoxidation of the olefin 55a

Several epoxidation attempts of olefin 55a were made under different classical conditions, as reported in the literature ${ }^{84,85}$ Firstly, the epoxidation reaction with $m$ CPBA afforded a product that was identified by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ as the diol 70 obtained by hydrolysis of the epoxide 69. Indeed, due to the bonded aromatic substituents, the epoxide 69 is unstable and reacts very easily with nucleophilic groups thereby increasing its stability. Addition of a base $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right.$ or $t$-BuOK) did not improve this reaction. (Table 3).

Scheme 40. Epoxidation attempts of olefin 55a. Reagents and conditions: a) mCPBA (1.2 eq), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}$, $48 \mathrm{~h}, 70,76 \%$. b) mCPBA (1.2 eq), $\mathrm{K}_{2} \mathrm{CO}_{3}(1.2 \mathrm{eq})$ or $t$-BuOK (1.2 eq), rt, $48 \mathrm{~h}, 70,79 \%$.

The results showed that the epoxide 69 is not stable enough and easily hydrolyzed in more stabilized compounds in the conditions applied.

Different reaction conditions employing NBS, $\mathrm{AcOH} / \mathrm{H}_{2} \mathrm{O} 7: 3,1,4$-dioxane and $\mathrm{Na}_{2} \mathrm{CO}_{3}$ led to the recuperation of the starting material and formation of a by-product that was identified by ${ }^{1} \mathrm{H}$ NMR and MS as the C-2 bromine derivative 71 (MS (EI) $\mathrm{m} / \mathrm{z}=486$ ) (Scheme 41).

[^32]

Scheme 41. Epoxidation attempts of olefin 55a. Reagents and conditions: 1) NBS (1.2 eq, AcOH (1 eq), Dioxane/ $\mathrm{H}_{2} \mathrm{O} 7: 3,16$ h. 2) $\mathrm{Na}_{2} \mathrm{CO}_{3}$ (2 eq), rt, 96 h, 55a (65\%), 71 (31\%).

The results show that the C-2 position of 55a is more reactive than the central olefin, making it difficult to selectively brominate the double bond in this position.

### 3.3.5. Preparation of pyrazolone derivatives

Pyrazolone derivatives are an important class of heterocyclic compounds present in many drug and synthetic products. The work presented in this section describes the preparation of pyrazolone derivatives from the previously synthesized carboxylic acid 53 and ester 54. Firstly, a cyclization reaction with the ester 54 and phenylhydrazine as the nucleophile and solvent at $200{ }^{\circ} \mathrm{C}$ for 24 h afforded a new product that was identified by ${ }^{1} \mathrm{H}$ NMR as the non cyclized phenylhydrazide derivative. The intramolecular cyclization has not been detected. Secondly, a cyclization reaction was attempted with the ester 54, hydroxylamine, HOBt and $\mathrm{Na}_{2} \mathrm{SO}_{4}$ in refluxing DCM for 1 week, which yielded only starting material. The addition of a base $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ did not improve this reaction. Finally, the cyclization of the carboxylic acid 53 with hydrazine hydrate, CSA and HOBt in MeOH at $66^{\circ} \mathrm{C}$ for 72 hours yielded the corresponding five-membered-ring pyrazolone derivative 16 in $28 \%$ yield. Cyclization of 54 with an excess of hydrazine hydrate in MeOH at reflux temperature for 72 hours afforded 16 in 52\% yield. (Table 4). ${ }^{86,87}$

[^33]Table 3. Reaction conditions of pyrazolone derivatives

| Entry | R | Reagents | Reaction conditions | Product |  | Observations |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | X | Y |  |
| 1. | Me | PhNHNH2 | $200{ }^{\circ} \mathrm{C}, 24 \mathrm{~h}$ | NH | Ph | Non cyclized hydrazide |
| 2. | Me | NH2OH, HOB , $\mathrm{Na}_{2} \mathrm{SO}_{4}$ | DCM, reflux, 1 week | 0 | H | Starting material |
| 3. | Me | $\begin{gathered} \mathrm{NH}_{2} \mathrm{OH}, \mathrm{HOB} t, \mathrm{~K}_{2} \mathrm{CO}_{3}, \\ \mathrm{Na}_{2} \mathrm{SO}_{4} \end{gathered}$ | DCM, reflux, 1 week | 0 | H | Starting material |
| 4. | H | $\mathrm{NH}_{2} \mathrm{NH}_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{CSA},$ <br> HOB $t$ | MeOH, reflux, 72 h | NH | H | 16 (28\%) |
| 5. | Me | $\mathrm{NH}_{2} \mathrm{NH}_{2} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{Na}_{2} \mathrm{SO}_{4}$ | MeOH, reflux, 72 h | NH | H | 16 (52\%) |

 of 16 (Table 3 ). The $(E)$ configuration isomer of 16 was not detected in any of the two studied cyclization reaction. The low yields obtained in entry 4 and 5 are explained by the formation of the vinyl pyrazolone by-product 74 in $14 \%$ and $16 \%$ yield respectively (Scheme 40).

[^34]

Scheme 40. Formation of the by-product 74.

The pyrazolone 16 was $O$-debenzylated in a hydrogenolysis with addition of hydrogen gas catalyzed by palladium on charcoal to afford the corresponding deprotected phenol $\mathbf{1 7}$ in a moderate yield. Similary, the double reduction of the by-product $\mathbf{7 4}$ by hydrogenolysis catalyzed by palladium on charcoal afforded 17 in moderate yield (Scheme 41).

Scheme 41. Hydrogenation reaction of 16 and 74. Reagents and conditions: a) $\mathrm{Pd} / \mathrm{C}(10 \% \mathrm{~m} / \mathrm{m}), \mathrm{HCl}(40$ $\mu \mathrm{L}$ of a 5 N aqueous solution), $\mathrm{H}_{2}$, $\mathrm{EtOAc}, \mathrm{rt}, 16 \mathrm{~h}, 33 \%$. b) $\mathrm{Pd} / \mathrm{C}(10 \% \mathrm{~m} / \mathrm{m}), \mathrm{HCl}(40 \mu \mathrm{~L}$ of a 5 N aqueous solution), $\mathrm{H}_{2}$, EtOAc, rt, $16 \mathrm{~h}, 90 \%$.

Compounds 16 and 17 were submitted to Lilly Laboratories (Indianapolis, USA) for biological testing.

### 3.3.6. Synthesis of 6 ring cyclized combretastatin analogues

### 3.3.6.1. Synthesis attempts to 1,2-oxazine derivatives

Several conditions were tested for the synthesis of 1,2-oxazine derivatives according to the literature procedure. ${ }^{88}$ Firstly, a cyclization reaction of 54 with N hydroxypropanimidoyl chloride and $\mathrm{Et}_{3} \mathrm{~N}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at rt for 5 h afforded starting material only. Another cyclization attempt with $N$-hydroxypropanimidoyl chloride, HOBt and DMAP in MeOH at $66^{\circ} \mathrm{C}$ for 16 h yielded the $\mathrm{C}-2^{\prime}$ chlorinated compound and no olefin cyclization was observed (Scheme 42). The $N$-hydroxypropanimidoyl chloride was previously prepared from commercially available propanal. ${ }^{89}$

Scheme 42. Reagents and conditions: a) Hydroxylamine chloride ( 1 eq ), $\mathrm{NaOH}(5 \mathrm{~mL}$ of a saturated aqueous solution), EtOH ( 15 mL ), reflux, $2 \mathrm{~h}, 87 \%$. b) NCS ( 1 eq ), MeOH ( 20 mL ), rt, $16 \mathrm{~h},>100 \%$ (crude). c) N -hydroxypropanimidoyl chloride ( 20 eq ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(30 \mathrm{~mL}, \mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq}), 5 \mathrm{~h}, \mathrm{SM}\right.$ only. d) N hydroxypropanimidoyl chloride (20 eq), HOBt (2 eq), MeOH ( 20 mL ), $78{ }^{\circ} \mathrm{C}, 16 \mathrm{~h}, \mathrm{C}-2^{\prime}$-chlorinated compound.

### 3.3.6.2. Synthesis of combretastatin naphtalene derivatives

A number of attempts to the synthesis of combretastatin naphtalene derivatives were carried out. Firstly, a Diels Alder reaction between 55a and 1,3-diphenylisobenzofuran in toluene at $90^{\circ} \mathrm{C}$ for 5 h yielded starting material 55a and the diketone proceding from the opening of the diene (Scheme 43).

[^35]

76
Scheme 43. Diels Alder cyclization reaction from 55a. Reagents and conditions: 1,3diphenylisobenzofuran ( 1 eq ), toluene ( 10 mL ), $90^{\circ} \mathrm{C}, 5 \mathrm{~h}, \mathrm{SM}$ and diketone only.

On the basis of these results, a second attempt with 55 a as starting material and $\mathrm{Yb}(\mathrm{OTf})_{3}$ as catalyst in toluene at $90^{\circ} \mathrm{C}$ during 5 h afforded starting material and the diketone only. Heating up to $100^{\circ} \mathrm{C}$ for 72 h did not improve the reaction (Scheme 44).

Scheme 44. Diels Alder cyclization reaction of ester 54. Reagents and conditions: a) 1,3diphenylisobenzofuran ( 1 eq ), $\mathrm{Yb}(\mathrm{OTf})_{3}(\mathrm{cat})$, toluene ( 10 mL ), $90^{\circ} \mathrm{C}, 5 \mathrm{~h}, \mathrm{SM}$ and diketone only. b) 1,3diphenylisobenzofuran ( 1 eq ), $\mathrm{Yb}(\mathrm{OTf})_{3}(\mathrm{cat})$, toluene $(10 \mathrm{~mL}), 100^{\circ} \mathrm{C}, 72 \mathrm{~h}, \mathrm{SM}$ and diketone only.

### 3.3.7. Other combretastatin analogue synthesis

The benzoic condensation is a reaction between two aromatic aldehydes. This reaction is catalyzed by a nucleophile such as the cyanide anion (CN) or other derivatives. The desired product is an aromatic acyloin. A possible mechanism of this reaction was proposed by A. J. Lapworth (Scheme 45). ${ }^{90}$

[^36]

Scheme 45. Mechanism of the benzoic condensation.

A benzoic condensation attempt of 3,4,5-trimethoxybenzaldehyde (29) with 3-benzyl-4methylbenzaldehyde (57) was carried out according to the literature procedure. ${ }^{91}$ Treatment of the aldehydes $\mathbf{2 9}$ and $\mathbf{5 7}$ with NaCN and water in EtOH afforded 3 new products. The ${ }^{1} \mathrm{H}$ NMR spectrum of all the isolated products showed presence of the 2 starting materials and of 2-hydroxy-2-(3,4,5-trimethoxyphenyl)acetonitrile, 2-(3-(benzyloxy)-4-methoxyphenyl)-2-hydroxyacetonitrile, and (E)-1,2-bis(3-benzyloxy)-4methoxyphenyl)ethane (Scheme 46).

Scheme 46. Reagents and conditions: a) $\mathrm{NaCN}(1 \mathrm{eq})$, $\mathrm{EtOH}(20 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL}), 78{ }^{\circ} \mathrm{C}, 16 \mathrm{~h}$, complex mixture.

The singlet at 6 ppm of the CH in alpha of the alcohol of the desired product was not observed in any of the final products, which means that the desired product was not formed.

[^37]
### 3.3.8. Preparation of azoledione combretastatin derivatives

The azolediones, unsaturated imides, are interesting building blocks in organic synthesis and a class of compounds with several biological properties. In this section the preparation of new disubstituted azoledione derivatives or disubstitued maleimides related to combretastatin A-4 is reported. A very practical and efficient synthesis of the azoledione 15 was achieved from 2-oxo-2-(3,4,5trimethoxyphenyl)acetic acid (80) and 4-benzyloxy-3-methoxyphenylacetic acid (81) (Scheme 47).

Scheme 47. Retrosynthetic analysis of the azoledione combretastatin analogue 15.

This approach has been demonstrated to be efficient for the preparation of 2,3disubstituted maleimides with hindered susbstituents. ${ }^{92}$ This process implies formation of an anhydride which undergoes an intramolecular Perkin-type condensation to hydroxy imide followed by dehydratation to maleimide. Condensation of the ketoacid 80 with the arylacetic acid 81 in acetic anhydride at $130^{\circ} \mathrm{C}$ for 3 h led to the isolation of the anhydride 79. Due to stability problems of the anhydride group, the product was used crude without further purification. The treatment of the anhydride 79 with $\mathrm{NH}_{3}$ (25\% aqueous solution), $\mathrm{NH}_{4} \mathrm{Cl}$ and $\mathrm{NH}_{4} \mathrm{OAc}$ in DMF gave the disubstituted imide 14, which was then involved in a hydrogenolysis reaction catalyzed by palladium on charcoal yielding 15 in satisfactory yield (Scheme 48).

[^38]

Scheme 48. Reagents and conditions: a) $\mathrm{Ac}_{2} \mathrm{O}, 2 \mathrm{~h}, 150{ }^{\circ} \mathrm{C}$ (crude). b) $\mathrm{NH}_{3}$ ( $25 \%$ aqueous solution) (20 eq), $\mathrm{NH}_{4} \mathrm{Cl}(1 \mathrm{eq}), \mathrm{NH}_{4} \mathrm{OAc}(1 \mathrm{eq}), 125^{\circ} \mathrm{C}, 16 \mathrm{~h}, 42 \%$ over two steps. c) $\mathrm{Pd} / \mathrm{C}(10 \% \mathrm{~m} / \mathrm{m}), \mathrm{HCl}(40 \mu \mathrm{~L}$ of a 5 N aqueous solution), EtOAc, $\mathrm{H}_{2}, 16 \mathrm{~h}, 92 \%$.

Compounds 14 (O-protected) and 15 (O-deprotected) were submitted to the Lilly Laboratories (Indianapolis, USA) for biological testing to evaluate their biological properties and study the mechanism through which they produce antitumor activity.

### 3.4. Synthesis of dioxancarbazole derivatives

### 3.4.1. Retrosynthetic analysis

In our search for a good methodology orientated to the preparation of new dioxancarbazole derivatives, a retrosynthetic analytical approach starting from simple compounds is depicted in Scheme 32. The dioxancarbazole 21 and 22 were prepared from the corresponding alcohols 82 and 83 , which can be obtained by reduction of the esters 84 and 85 respectively. The intermediate esters 84 and 85 can be prepared in a single step from the aniline 86 and the bromoketoester 87 under the modified Bischler conditions (Scheme 49). ${ }^{93}$ The Bischler indole synthesis is based on the monoalkylation of the corresponding aniline with the bromoketoester, followed by an intramolecular electrophilic cyclization.

Scheme 49. Retrosynthetic analysis of 21 and 22.

[^39]
### 3.4.2. Synthesis of the dioxancarbazoles 21 and 22

This route began with bromination of the ketoester 88 with $\mathrm{Br}_{2}$ according to the literature procedure to afford the bromo ketoester 87 in quantitative yield. 87 was identical in all aspects with that previously described. ${ }^{94}$ The bromo ketoester 87 was condensed with 1,4-benzodioxan-6-amine in a modified Bischler reaction condition optimized recently by our research group (Scheme 50). ${ }^{95}$

Scheme 50. Reagents and conditions: a) $\mathrm{Br}_{2}, \mathrm{CHCl}_{3}, \mathrm{rt}, 72 \mathrm{~h}$, quant. b) 1,4-benzodioxan-6-amine (3 eq), $\mathrm{N}, \mathrm{N}$-dimethylaniline, $150^{\circ} \mathrm{C}, 1 \mathrm{~h}, 84$ (22\%), 85(12\%).

The aliphatic ester 84 was obtained as the major product in $22 \%$ yield. The aromatic ester 85 was obtained in $12 \%$ yield. The ester 85 was formed because of the instability of 84 that easily aromatizes at high temperatures. The low yield obtained in this reaction is explained by the non-linear cyclization of the imine intermediate that leads to the orthogonal 1,4-dioxancarbazole by-product 89 (Scheme 51).

Scheme 51. Linear and orthogonal cyclization of the aniline intermediate under modified Bischler reaction conditions.

[^40]The low yield of this reaction can also be explained by the hydrolysis of the esters formed to the corresponding carboxylic acid. (Scheme 52).

Scheme 52. Hydrolysis of ester 84 under the modified bishler reaction conditions

The separation of all the products formed by silica gel flash column chromatography led to the results and yields depicted on Scheme 53:

Scheme 53. Yields of all the obtained products of the modified Bishler reaction.

The esters 84 and 85 were reduced by $\mathrm{LiAlH}_{4}$ to afford the corresponding alcohols $\mathbf{8 2}$ and $\mathbf{8 3}$ in good yields (Scheme 54).

a)

Scheme 54. Reagents and conditions: a) $\mathrm{LiAlH}_{4}(4 \mathrm{eq}), \mathrm{THF}, \mathrm{rt}, 4 \mathrm{~h}, 82$ (83\%), 83 (73\%).

The alcohol 82 and 2-fluoro-5-(trifluoromethyl)phenyl isocyanate (95) were condensed in the presence of $E t_{3} \mathrm{~N}$ to give the dioxancarbazole 22 in good yield. Similarly, the alcohol 83 was coupled with 3-nitrophenyl isocyanate (96) in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ to provide 23 in low yield (Scheme 55).

Scheme 55. Synthesis of carbamate 22 and 23. Reagents and conditions: a) 2-fluoro-5(trifluoromethyl)phenylisocyanate ( 1 eq ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 16 \mathrm{~h}, 78 \%$. b) 3-nitrophenyl isocyanate (1 eq), $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 16 \mathrm{~h}, 14 \%$.

### 3.4.3. Synthesis attempts of side chain functionalization

In continuation of our current studies on the synthesis of functionalized dioxancarbazoles, we attempted to synthesize 97 from the alcohol 79 (Scheme 31). 79 was treated with $\mathrm{Tf}_{2} \mathrm{O}$ and $\mathrm{Et}_{3} \mathrm{~N}$ giving the triflate 98 which was used without further purification because of its low stability. Treatment of the triflate 98 with 3 -amine-2chloropyridine (99) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ led to decomposition of 98 and no sign of the desired product 97 (Scheme 56).

Scheme 56. Synthesis attempt of dioxancarbazole 97. Reagents and conditions: a) $\mathrm{Tf}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}^{2} \mathrm{CH}_{2} \mathrm{Cl}_{2}, 3 \mathrm{~h}$ at $-78^{\circ} \mathrm{C}$ and 3 h at $\mathrm{rt},>100 \%$ (crude) b) 3 -amine-2-chloropyridine ( 1.5 eq ), $\mathrm{K}_{2} \mathrm{CO}_{3}(2 \mathrm{eq}), \mathrm{DMF}, 8{ }^{\circ} \mathrm{C}, 16$ h, decomposition of 98 .

The ${ }^{1} \mathrm{H}$ NMR ( $7.82 \mathrm{ppm}, 2 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{2}$ ) and MS data ( $\mathrm{M}=365.1$ ) revealed that the elimination product 100 was formed (Scheme 57).

Scheme 57. Product of elimination of the triflate group.

On the basis of these results, an alternative synthesis of 97 and 101 was attempted forming the bromo- or chloro- derivative intermediate 102 and 103. Treatment of alcohol 75 with $\mathrm{PPh}_{3}$ and NBS led to decomposition of starting material. Similarly, treatment of alcohol 76 with $\mathrm{SOCl}_{2}$ led to starting material decomposition and no sign of the desired chloro derivative 103 (Scheme 58).

Scheme 58. Synthesis attempts of 97 and 101. Reagents and conditions: a) NBS (2 eq), $\mathrm{Ph}_{3} \mathrm{P}(2 \mathrm{eq}), \mathrm{DMF}$, $40{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}, \mathrm{SM}$ decomposition. b) $\mathrm{SOCl}_{2}(2 \mathrm{~mL})$ used as reactive and solvent, starting material decomposition.

The ${ }^{1} \mathrm{H}$ NMR data of these reactions showed dissapearance of aliphatic protons and appearance of new aromatic signals, revealing formation of the fully aromatized dioxancarbazole 104 ( $2.44 \mathrm{ppm}\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}-\mathrm{Ar}\right.$ ), 7.95 (d, J = $7.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{Ar}$ ), 7.43 (d, J $=7.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{Ar}), 7.28(\mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{Ar})$. This can be explained by the fact that leaving groups in beta position of aromatic systems are very labile and are easily eliminated en more stable conjugated derivative that, in this case, ends up aromatizing the D ring (Scheme 59). The 3 -amino-2-chloropyridine is here acting as a base and attacking a beta hydrogen of the halogenated chain ( $E_{2}$ mechanism).

Scheme 59. Aromatization of bromo- or chloro- benzodioxancarbazole derivatives.

### 3.5. Preparation of resveratrol analogues

### 3.5.1. Preparation of benzofuran resveratrol analogues

### 3.5.1.1. Retrosynthetic analysis

At a first stage, two retrosynthetic analysis of a cyclic resveratrol analogue were outlined. The furan 23 can be obtained from the lactone 105, which can be prepared by condensation of the carboxylic acid 56 with the aldehyde 106 under Perkin-type reaction conditions. The Perkin reaction is an organic reaction used to convert an aromatic aldehyde and a carboxylic acid (anhydride) to an $\alpha, \beta$-unsaturated carboxylic acid or a coumarin. ${ }^{96}$ Alternatively, the furan 23 could be synthesized from the trans stilbene 107, which can be obtained by condensation of the aromatic aldehydes 108 and 29 (Scheme 60).

Scheme 60. Two retrosynthetic analysis of the furan resveratrol analogue 23

### 3.5.1.2. Synthesis of the benzofuran 23

A multistep approach for the preparation of resveratrol analogues was proposed. Firstly, a condensation of 3,4,5-trimethoxyphenylacetic acid (56) with 2,4dihydroxybenzaldehyde (106) under Perkin-type conditions with $\mathrm{Ac}_{2} \mathrm{O}$ and $\mathrm{Et}_{3} \mathrm{~N}$ led to 105 in moderate yield. The corresponding lactone 105 was hydrolyzed and involved in an intramolecular cyclization reaction with HCl 2 N to afford the benzofuran $\mathbf{2 4}$ in

[^41]moderate yield. The methoxyl groups of $\mathbf{2 4}$ were cleaved by treatment with $\mathrm{BBr}_{3}$ at 0 ${ }^{\circ} \mathrm{C}$ affording 23 in satisfactory yield (Scheme 61).

Scheme 61. Preparation of furan resveratrol analogue 23. Reagents and conditions: a) $\mathrm{Et}_{3} \mathrm{~N}(5 \mathrm{eq}), \mathrm{Ac}_{2} \mathrm{O}$, reflux, $3 \mathrm{~h}, 47 \%$. b) EtOH / $\mathrm{HCl}(2 \mathrm{~N}) 8: 2$, reflux, $16 \mathrm{~h}, 29 \%$ c) $\mathrm{BBr}_{3}(20 \mathrm{eq})$, DCM, rt, $3 \mathrm{~h}, 51 \%$.

A possible mechanism for the acid-mediated cyclization reaction is depicted in Scheme 62.

Scheme 62. Proposed mechanism of the acid-mediated cyclization reaction to form the furan 24

Secondly, a McMurry reaction between 3,4,5-trimethoxyaldehyde (29) and 2,4dimethoxybenzaldehyde (108) led to the trans stilbene 109 in moderate yield. ${ }^{97}$ The Mc Murry reaction is known as an organic reaction in which two aryl ketones or arylaldehydes are condensed to give an alkene using $\mathrm{TiCl}_{4}$ and $\mathrm{Zn}^{\circ}$ as a reducing agent.

[^42]This reaction consists in a reductive condensation of carbonyl compounds. A possible mechanism for the Mc Murry reaction is depicted in Scheme 63.

Scheme 63. Proposed mechanism of the Mc Murry reaction

The 5 methoxyl groups of 109 were then cleaved with $\mathrm{BBr}_{3}$ to afford the pentaphenol stilbene 107 in quantitative yield (Scheme 64).

Scheme 64. Reagents and conditions: a) $\mathrm{Zn}(5 \mathrm{eq}), \mathrm{TiCl}_{4}(2.5 \mathrm{eq})$, $\mathrm{THF}\left(30 \mathrm{~mL}\right.$ ), reflux, $72 \mathrm{~h}, 38 \%$ b) $\mathrm{BBr}_{3}$ (10 eq), $0^{\circ} \mathrm{C}, 30 \mathrm{~min}, 98 \%$.

Finally, an intramolecular cyclization reaction with PTSA in toluene led to decomposition of the starting material into 3,4,5-trihydroxybenzaldehyde (110) and 2,4-dihydroxybenzaldehyde (106). Another synthesis attempt of $\mathbf{2 3}$ from $\mathbf{1 0 7}$ using $I_{2}$ in an iodination reaction and performing the cyclization reaction with $\mathrm{Et}_{3} \mathrm{~N}$ in EtOH also led to the decomposition of starting material into 106 and 110 (Scheme 65).

Scheme 65. Reagents and conditions: a) PTSA ( 0.2 eq ), toluene, reflux, 72 h , decomposition into 106 and 110. b) 1) $\mathrm{I}_{2}(1.1 \mathrm{eq}), \mathrm{DCM}$, acetone, rt, 16 h .2 ) $\mathrm{Et}_{3} \mathrm{~N}(1.5 \mathrm{eq})$, EtOH , reflux, 16 h , decomposition into 106 and 110.

### 3.5.2. Preparation of indole resveratrol analogues

### 3.5.2.1. Synthesis attempt of trimethoxyphenylindole resveratrol analogue 111

In continuation of our current studies on the synthesis of indole resveratrol analogue, the synthesis of the índole derivative 111 was attempted from 2-bromo-1-(3,4,5dimethoxyphenyl)ethanone (112) and 3-benzyloxyaniline (113) (Scheme 66).

Scheme 66. Retrosynthetic analysis of the disubstitued indole analogue 111

Firstly, bromination of the 3,4,5-trimethoxyacetophenone (114) with NBS in AcOH at $80^{\circ} \mathrm{C}$ led to both bromination on the alpha position of the ketone and on the aromatic ring. The same reaction at rt led to bromination on the aromatic ring only (Scheme 67). These results show that the $\mathrm{C}-2$ and $\mathrm{C}-6$ position of the aromatic ring are more reactive than the alpha position of the ketone.

Scheme 67. Synthesis attempts of 112. Reagents and conditions: a) NBS (1.2 eq), AcOH (1.2 eq), $\mathrm{CCl}_{4}, 80$ ${ }^{\circ} \mathrm{C}, 22 \%$. b) NBS ( 1.2 eq ), $\mathrm{AcOH}(1.2 \mathrm{eq}), \mathrm{CCl}_{4}, \mathrm{rt}, 115$ (56\%) and 116 ( $44 \%$ ).

On the basis of these results, another synthetic route to obtain 112 was attempted from 1,2,3-trimethoxybenzene (117). Acylation of 117 with bromoacetyl bromide and $\mathrm{TiCl}_{4}$ did not form 112 and only the 2-bromo-1-(2,3,4-trimethoxyphenyl)ethanone (118) was observed (Scheme 68).

Scheme 68. Alternative synthesis attempt of 112. Reagents and conditions: Bromoacetyl bromide (1.5 eq), $\mathrm{TiCl}_{4}$ (excess, 1 mL ), $N, N$-dimethylaniline, $165^{\circ} \mathrm{C}, 1 \mathrm{~h}, \mathrm{SM}$ (11\%) and 118 ( $87 \%$ ).

These results show that, despite of the sterical hindrance of the ortho position, this site is more electronegative and acylation exclusively occurs in this position.

### 3.5.2.2. Synthesis attempt of dimethoxyphenyl indole derivative.

### 3.5.2.2.1. Synthesis of 3,4-dimethoxyphenyl indole 119

A number of attempts were made to synthesize the indole resveratrol analogue 119 from 3-benzyloxyaniline and 2-chloro-1-(3,4-dimethoxyphenyl)ethanone (120) or 2-bromo-1-(3,4-dimethoxyphenyl)ethanone (121). Firstly, chloration of 3,4dimethoxyacetophenone (122) with NCS and AcOH in $\mathrm{CCl}_{4}$ afforded 2-chloro-1-(3,4dimethoxyphenyl)ethanone (120) in quantitative yield. Treatment of 120 with 3benzyloxyaniline in $N, N$-dimethylaniline yielded products of decomposition of the 3 -
benzyloxyaniline and starting material only. An alternative synthesis was attempted to obtain 119. The 2-bromo-1-(3,4-dimethoxyphenyl)ethanone (121) was prepared by bromination of $\mathbf{1 2 2}$ with NBS in AcOH in moderate yield. Cyclization of 121 with 3benzyloxyaniline in $\mathrm{N}, \mathrm{N}$-dimethylaniline afforded products of decomposition of the 3benzyloxyaniline and starting material only (Scheme 69).

Scheme 69. Synthesis attempt of 119. Reagents and conditions: a) NCS (1.5 eq), $\mathrm{AcOH}(1 \mathrm{eq}), \mathrm{CCl}_{4}$, reflux, $92 \mathrm{~h}, 98 \%$. b) NBS (3 eq), AcOH (3 eq), reflux, $72 \mathrm{~h}, 40 \%$. c) $\mathrm{N}, \mathrm{N}$-dimethylaniline, $165^{\circ} \mathrm{C}, 1 \mathrm{~h}$, decomposition of the 3-benzyloxyaniline and SM.

### 3.5.2.2.2. Synthesis of 2,5-dimethoxyphenyl indole (26)

The preparation of indole 26 was carried out as depicted in Scheme 67. 3Benzyloxyaniline (113) and 2-bromo-1-(2,5-dimethoxyphenyl)ethanone (123) were involved in a modified Bischler reaction with $N, N$-dimethylaniline yielding 25 in moderate yield. ${ }^{98}$ Deprotection of the benzyl group in a catalytic hydrogenation by $\mathrm{H}_{2}$, $\mathrm{Pd} / \mathrm{C}$ in EtOAc and MeOH led to 26 in satisfactory yield (Scheme 70).

113

Scheme 70. Preparation of $\mathbf{2 3}$ and 24. Reagents and conditions: a) $N, N$-dimethylaniline, $165{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 53 \%$. b) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}, \mathrm{MeOH}, \mathrm{rt}, 16 \mathrm{~h}, 55 \%$.

The substituted indoles $\mathbf{2 5}$ and $\mathbf{2 6}$ were submitted to the laboratory Lilly (Indianapolis, USA) for biological testing to evaluate their biological activities and to study the mechanism of action.

4. Biological data

Thirteen compounds (1, 4, 5, 8, 9, 16, 17, 21, 22, 23, 24, 25 and 26) were sent to the Lilly laboratories (Indianapolis, USA) to determine their activities on K-Ras protein inhibition, anti-angiogenesis and anti-osteoporosis. Five other compounds (6, 7, 10, 11, $14,15)$ are to be tested soon. Topoisomerase II inhibition, CDK inhibition and toxicity of the above-mentionned compounds will also be tested. In order to determine if these compounds would have other interesting therapeutic properties, complementary assays on diabetes, neurologic disorders and other diseases were also carried out.

### 4.1. Antitumour activity assays

### 4.1.1. K-Ras, anti-angiogenesis and anti-osteoporosis biological results

### 4.1.1.1. Introduction

### 4.1.1.1.1. K-Ras/Wnt Synthetic Lethal

K-Ras is a protein that is encoded in humans by the K-Ras gene. K-Ras mutations are involved in the development of many cancers. Most colorectal cancers develop from benign lesions that are initiated by mutations in the protein adenomatous polyposis coli (APC). Progression to colorectal cancers requires a second event such as an activating KRas mutation, which is triggered by undefined interactions between the Wnt signaling pathways and the K-Ras protein. The Wnt signaling pathways are a group of proteins that pass signals from outside of a cell through cell surface receptors to the inside of the cell. The goal is to identify small molecules that are selectively lethal to tumor cells that depend on this Wnt-KRas synergy. ${ }^{99}$ In 2009, the FDA updated two drugs: panitumab and cetuximab (monoclonal antibodies) indicated for treatment of colorectal cancer and related to the K-Ras. ${ }^{100}$

The K-Ras synthetic lethal phenotypic module measures survival of colorectal cancers cells carrying mutations that activate both Wnt and K-Ras signaling relative to those

[^44]with other driver mutations. Confirmed actives are tested in a battery of phenotypic assays that are regulated through Wnt and/or K-Ras-signaling pathways. This strategy provides an opportunity to discover targeted agents with improve cancer vs. normal cell selectivity. The overall goal is to develop targeted therapies directed towards colorectal cancers patients with mutant K-Ras tumors. The K-Ras activity of the thirteen tested compounds were carried out on 4 different colon cancer cell lines (HCT KrasSL, RKO KrasSL, Colo 320 KrasSL and SNU-C1 KrasSL) in three different concentrations $(0.2 \mu \mathrm{M}, 2 \mu \mathrm{M}$ and $20 \mu \mathrm{M}) .{ }^{101}$ The activities of these compounds were compared to the Lilly lead compound $\mathbf{3 b}$ which has a significant K-Ras activity.

### 4.1.1.1.2. Anti-angiogenesis assays

Angiogenesis and vasculogenesis consist in blood vessel sprouting and tube formation. Vascular disrupting agents cause rapid collapse and shut down of established tumour blood vessels leading to regional tumour ischaemia and necrosis. ${ }^{102}$ The antiangiogenesis agents can bind the extracellular domain of VEGF receptor $-2^{103}$ or the ligands VEGF-A, VEGF-C and VEGF-D. ${ }^{104}$ Several anti-angiogenesis compounds are investigated in clinical trials for cancer treatment. The efficiency and safety of these agents have not been yet established.

Bevacizumab was the first angiogenesis inhibitor approved by the FDA. Other drugs with antiangiogenic activity were approved afterwards: sorafenib (Nexavar®), sunitinib (Stutent $®$ ) and pazopenib (Votrient $®$ ). ${ }^{105}$ Although K-Ras promotes angiogenesis, the function of mutant K-Ras activity in tumor angiogenesis process remains poorly understood. The last results suggest that angiogenesis is initiated by secretion of chemokinas and VEGF downstream of activated oncogenic K-Ras, and the vascular maturation is also dependent on MEK $1 / 2$ antibodies and C-Jun signaling proteins. ${ }^{106}$

[^45]
### 4.1.1.1.3. Anti-osteoporosis promoters

Osteoporosis is a disease that weakens bones over time and increases the risks of fractures. The mechanism of bone loss is not well understood, but in practical effect, the disorder arises from an imbalance in the formation of new healthy bones and the decrease and resorption of bone tissue. Osteoporosis triggers a decrease of bone protein matrix and mineral content.

The Bone Formation phenotypic assay module tests compounds for their ability to differentiate murine C2C12 cells, a cell line with multi-lineage potential, to an osteoblast-like phenotype through beta-catenin-dependent stimulation of alkaline phosphatase activity. Secondary assays confirm the osteogenic activity of the compounds in both rodent and human multi-potential cell populations. Compounds of interest increase osteoblast formation in rodent and human cellular assays through a non-glycogen synthase kinase (GSK) mechanism. ${ }^{107}$

[^46]
### 4.1.1.2. Antitumour activity of the tetrahydroisoquinoline analogues

### 4.1.1.2.1. K-Ras inhibition (Table 8)

Table 8. K-Ras inhibition of the tetrahydroisoquinoline analogues

Footnote: SNU-C1, Colo 320, RKO and HCT are colon cancer cell lines.

The results show that all of the studied compounds have a higher overall K-Ras inhibition than the lead compound 3b, which means that those products have a high KRas inhibition activity. Surprisingly, the alcohol 1 displayed a lower inhibition than the other isoquinoline analogues. The amine isoquinoline $\mathbf{5}$ presents the highest K-Ras activity of all the tested tetrahydroisoquinoline analogues, which reveals that a terminal ionic interaction results in an increase of K-Ras inhibition. The N arylisoquinoline $\mathbf{8}$ and $\mathbf{9}$ have the highest K-Ras inhibition on Colo 320 Kras SL cell line, which suggests that a low electron density aromatic side chain structure results in a higher K-ras activity for this type of cancer cells. The isoquinoline 9 shows a surprisingly high K-Ras activity at $0.2 \mu \mathrm{M}$ concentration (RKO KrasSL 95.8\% inhib., HCT

KrasSL 35.9\% inhib.) which suggests that its activity is not dose-dependant for these types of cancer lines.

### 4.1.1.2.2. Anti-angiogenesis and anti-osteoporosis activity (Table 9)

Table 9. Anti-angiogenesis and anti-osteoporosis activity of the tetrahydroisoquinoline analogues

| Products <br> Assays |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 0 | 15 | 8.5 | 6 | 16.6 |
|  |  | \% Inhib $10 \mu \mathrm{M}$ | 6.7 | 76.9 | 58.6 | 37.5 | 55.3 |
|  |  | $\mathrm{IC}_{50}$ | N.A | $2.886 \mu \mathrm{M}$ | $6.539 \mu \mathrm{M}$ | $>10 \mu \mathrm{M}$ | $>10 \mu \mathrm{M}$ |
|  |  | $\mathrm{IC}_{50}$ | N.A | $>10 \mu \mathrm{M}$ | >10 $\mu \mathrm{M}$ | $>10 \mu \mathrm{M}$ | >10 $\mu \mathrm{M}$ |
|  |  | \% Stim $2 \mu \mathrm{M}$ | 0 | 4.6 | 0 | 0.3 | 27.2 |
|  | Ơ0 | \% Stim $10 \mu \mathrm{M}$ | 2,9 | 51,8 | 25,4 | 4,3 | 14,2 |

Footnote: Angiogenesis nuclear area, b-catenin osteoporosis and angiogenesis tube area (tracheal tube area)

The results show that the isoquinolines $\mathbf{4}, \mathbf{5 , 8}$ and $\mathbf{9}$ posess a high anti-angiogenesis activity while compound $\mathbf{1}$ is little active. The nitrile isoquinoline $\mathbf{4}$ has the highest antiangiogenesis and anti-osteoporosis activity, which suggests that a dipolar lipophilic terminal group such as a nitrile group results in an increase of anti-angiogenesis and anti-osteoporosis activity.

### 4.1.1.3. Antitumour activity of the combretastatin analogues

### 4.1.1.3.1. K-Ras inhibition (Table 10)

Table 10. K-Ras inhibition of the combretastatin analogues $\mathbf{1 6}$ and 17

| Products <br> Assays |  |  | Lilly's lead compound 3b |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 31.2 | 0 | 0 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 1.2 | 11.3 | 57.9 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 52.4 | 9.5 | 100 |
|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 0 | 1.5 | 33.7 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 12.1 | 2.6 | 62.4 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 41 | 44.3 | 97.3 |
|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 0 | 0 | 21 |

|  |  | \% Inhib $20 \mu \mathrm{M}$ | 85.4 | 29.5 | 73.1 |
|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 21 | 10.2 | 12.8 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 14.2 | 6.5 | 58.3 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 18.8 | 0 | 50.7 |

Footnote: SNU-C1, Colo 320, RKO and HCT are colon cancer cell lines.

According to the results, the $O$-benzylated pyrazolone 16 presents a moderate K-Ras activity on the RKO KrasSL and the Colo 320 KrasSL cell lines and low to no K-Ras activity for the two other tested cell lines. However, the O-debenzylated pyrazolone 17 shows the highest overall K-Ras activity of all tested compounds and the highest activity on the HCT KrasSL cell line. It also has a high K-ras activity at low concentrations compared to the other tested compounds. The structure activity relationship between analogues 16 and 17 reveals that the arylalcohol at the C-3' position plays an important role in its K-Ras activity. In other words, small electronegative groups at the C-3' position dramatically increases the compound K-Ras activity.

### 4.1.1.3.2. Anti-angiogenesis activity (Table 11)

Table 11. Anti-angiogenesis activity of the combretastatin analogues

|  | Assays | roducts |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 9.8 | 100 |
|  |  | \% Inhib $10 \mu \mathrm{M}$ | 38.7 | 100 |
|  |  | $\mathrm{IC}_{50}$ | $>10 \mu \mathrm{M}$ | $0.507 \mu \mathrm{M}$ |
|  |  | $\mathrm{IC}_{50}$ | >10 $\mu \mathrm{M}$ | $>10 \mu \mathrm{M}$ |
|  |  | \% Stim $2 \mu \mathrm{M}$ | 0 | 78.6 |
| $\begin{aligned} & 0 \\ & \vdots \\ & \vdots \\ & 3 \end{aligned}$ | $\begin{aligned} & \stackrel{\sim}{ \pm} \\ & \stackrel{H}{0} \end{aligned}$ | \% Stim 10رM | 4.4 | 65.2 |

Footnote: Angiogenesis nuclear area, b -catenin osteoporosis and angiogenesis tube area (tracheal tube area)

The results show that the pyrazolone 17 presents a very high anti-angiogenesis effect with a $100 \%$ inhibition at a $2 \mu \mathrm{M}$ concentration. It is the highest anti-angiogenesis and anti-osteoporosis activity of all the tested products with an $\mathrm{IC}_{50}$ of 507 nM . It also has the highest anti-osteoporosis activity of all the tested products. The O-benzylated pyrazolone $\mathbf{1 6}$ presents a lower anti-angiogenesis and anti-osteoporosis activity, which reveals that the arylalcohol at the $\mathrm{C}-3^{\prime}$ position also plays an important role in its angiogenesis and anti-osteoporosis activity.

### 4.1.1.3.3. CDKs and cell cycle inhibition

Compound $\mathbf{1 7}$ being the most active of all tested compounds, complementary assays on CDKs and cell cycle inhibition were carried on as shown on table 12 and table 13. The $\mathrm{IC}_{50}$ of analogue 17 was determined for each phase of the cell cycle, and to be more precise, for each $\mathrm{G}_{2}$ sub-phase (Table 12).

Table 12. Cell cycle inhibition of compound 17

The results show that the pirazolone 17 possesses a high activity on the $\mathrm{G}_{2} \mathrm{M}$ cell cycle phase and its sub-phase. Therefore, compound 17 has a different mechanism of action to combretastatin A-4, which has an antimitotic mechanism of action that essentially occurs much more in the $M$-phase (69.75\%) and not much in the $G_{2} / M$-phase ( $30.25 \%$ ) (Scheme 71). ${ }^{108}$

Scheme 71. Localisaion of the $\mathrm{G}_{2} \mathrm{M}$ phase. ${ }^{109}$

The antitumour activity of the pirazolone 17 was tested on various types of CDKs (Table 13)

[^47]Table 13. CDK inhibition of compound 17

| $\mathrm{H}_{3} \mathrm{CO}-1 / 10$ | 0 | 2.30 | 0 | 0 | 0 | 0 |

The results show that $\mathbf{1 7}$ have little to no activity on the studied CDKs (<30\% of inhibit. at $20 \mu \mathrm{M})$. Therefore, compound $\mathbf{1 7}$ is not an inhibitor of these CDKs.

Biological trials from Dr Nuria Mur Blanch's thesis revealed that combretastatin A-4 has a nano molar antitumour activity on numerous cancer cell lines ( $\mathrm{B}-16$ mouse melanoma $\mathrm{IC}_{50}=3 \mathrm{nM}$, K 562 human leukemia $\mathrm{IC}_{50}=3 \mathrm{nM}$, LoVo colon cancer $\mathrm{IC}_{50}=$ $0,015 \mathrm{nM}$, HT-29 human colon cancer $\mathrm{IC}_{50}=0.006 \mathrm{nM}$, colo 205 colon cancer $\mathrm{IC}_{50}=$ 0.02 nM , DLD-1 colorectal adenocarcinoma $\mathrm{IC}_{50}=0.015 \mathrm{nM}$ and HCT-15 colon cancer $\left.\mathrm{IC}_{50}=0.003 \mathrm{nM}\right)^{59}$. Therefore, the combretastatin A-4 analogue 17 seems to present a lower activity than combretastatin A-4. However, the K-Ras biological assays of compound 17 being quite different from the more general biological trial of combretastatin A-4, these two assays are difficult to compare with one another.

### 4.1.1.4. Antitumour activity of the dioxancarbazole analogues

### 4.1.1.4.1. K-Ras inhibition (Table 14)

Table 14. K-Ras inhibition of the dioxancarbazole analogues 21 and 22

|  | says | Products | Lilly's lead compound 3b |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\text { 토 } \underset{\underline{N}}{\tilde{N}}$ | \% Inhib $0.2 \mu \mathrm{M}$ | 31.2 | 33.5 | 32.5 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 1.2 | 8.6 | 16.3 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 52.4 | 52.1 | 98.7 |
|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 0 | 5.2 | 6.5 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 12.1 | 5.6 | 20.6 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 41 | 53.6 | 100 |

|  |  | \% Inhib $0.2 \mu \mathrm{M}$ | 21 | 7.1 | 7.7 |
|  |  | \% Inhib $2 \mu \mathrm{M}$ | 14.2 | 2.5 | 8.2 |
|  |  | \% Inhib $20 \mu \mathrm{M}$ | 18.8 | 63.2 | 55.6 |

Footnote: SNU-C1, Colo 320, RKO and HCT are colon cancer cell lines.

According to the results, the dioxancarbazoles $\mathbf{2 1}$ and $\mathbf{2 2}$ have a high K-Ras activity. Compound $\mathbf{2 2}$ possesses the highest activity on RKO KrasSL cell line of all the tested compounds and a higher overall K-Ras activity than the dioxancarbazole 21. Both compounds $\mathbf{2 1}$ and $\mathbf{2 2}$ present a high K-Ras activity on HCT KrasSL cell line at low concentration, which suggests that their activity is not dose-dependant for this type of cell line.

### 4.1.1.4.2. Anti-angiogenesis activity (Table 15)

Table 15. Anti-angiogenesis activity of the combretastatin analogues

| Products <br> Assays |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | \% Inhib <br> $2 \mu \mathrm{M}$ | 26.3 | 6.1 |
|  |  | \% Inhib $10 \mu \mathrm{M}$ | 13.9 | 54.3 |

|  |  | $\mathrm{IC}_{50}$ | N.A | $>10 \mu \mathrm{M}$ |
| $\stackrel{+}{\Sigma}$ |  | $\begin{gathered} \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 2.5 | 0 |
|  |  | $\begin{gathered} \text { \% Stim } \\ 10 \mu \mathrm{M} \end{gathered}$ | 3.1 | 2.5 |

Footnote: Angiogenesis nuclear area, b-catenin osteoporosis and angiogenesis tube area (tracheal tube area)

The results reveal that the dioxancarbazole 22 presents a high anti-angiogenesis activity with an $\mathrm{IC}_{50}$ of $9.6 \mu \mathrm{M}$, while analogue $\mathbf{2 1}$ has no significant activity. Neither of compound 21 and $\mathbf{2 2}$ have a significant anti-osteoporosis activity on the carried out tests.

### 4.1.1.5. Antitumour activity of the resveratrol analogues

### 4.1.1.5.1. K-Ras inhibition (Table 16)

Table 16. K-Ras inhibition of the resveratrol analogues

| Assays |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

According to the results, the four tested resveratrol analogues have a low to moderate K-ras activity depending on the cancer cell line. 23 and 24 have a moderate K-ras activity on the RKO KrasSL cell line and low or no activity on the other cancer cell lines. The trihydroxy group of $\mathbf{2 3}$ does not bring a better K-Ras activity compared to the trimethoxy group of 24, which suggests that neither the polarity nor the geometry of this moiety are decisive for its K-Ras activity. $\mathbf{2 5}$ has a moderate K-ras activity on HCT KrasSL, RKO KrasSL and SNU-C1 KrasSL cell lines. 26 has a moderate K-ras activity on Colo 320 Kras SL and SNU-C1 KrasSL. The difference of activity of $\mathbf{2 5}$ and $\mathbf{2 6}$ suggests that the benzyl group is important for the selectivity of the activity of these compounds between the different colon cell lines. $\mathbf{2 5}$ has nearly the same K-Ras
activity on RKO KrasSL at high and low concentration, which suggests that its activity is not dose-dependent.

### 4.1.1.5.2. Antiangiogenesis activity (Table 17)

|  |  | $\mathrm{IC}_{50}$ | N.A | N.A | N.A | >10 $\mu \mathrm{M}$ |
| $\stackrel{\text { c }}{\substack{1 \\ 3}}$ |  | $\begin{gathered} \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 0 | 2 | 14.1 | 0.7 |
| $\begin{aligned} & \stackrel{0}{2} \\ & \stackrel{H}{c} \end{aligned}$ | $$ | $\begin{aligned} & \text { \% Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 5.5 | 10.2 | 5.4 | 8.1 |

Footnote: Angiogenesis nuclear area, b-catenin osteoporosis and angiogenesis tube area (tracheal tube area)

Results of the four tested combretastatin analogues showed that only $\mathbf{2 6}$ has a significant anti-angiogenesis activity. Non of them have a significant osteoporose activity.

The K-Ras, antiangiogenesis and antiosteoporosis activity of these resveratrol analogues were compared to the resveratrol antitumour activities activities described in the litterature. However, as the cell lines activities found were different and described in dosis/duration instead of percentage of inhibition, it was not possible to make a clear comparation of these two studies. ${ }^{110}$

[^48]
### 4.1.2. Complementary antitumor activity assays

Compounds 10, 11, 23 and 24 were sent to the department of pharmacy of the university of Palermo (Italy) to determine their activites on tumor cells. The antitumor activity of these compounds were tested in three different types of cancer cell lines: The human chronic myelougenous leukaemia cell line K562, the human non-small-lung cancer NCI-H460 and a human colon cancer cell line HT-29 (Table 18).

Table 18. $\mathrm{K} 562, \mathrm{NCI}-\mathrm{H} 460$ and HT29 cell viability after treatment with $10 \mu \mathrm{M}$ of test compounds

| Assays | K562 | NCI-H460 | HT29 |
| :---: | :---: | :---: | :---: |
| Products | \% inhibition [10 $\mu \mathrm{M}$ ] | \% inhibition [ $10 \mu \mathrm{M}$ ] | \% inhibition [10 $\mu \mathrm{M}$ ] |
| Ellipticine | 73.5 | 97.7 | 98.8 |
|  | 2.4 | 0 | 0 |
|  | 19.9 | 12.9 | 0 |
|  | 22.2 | 0 | 0 |
|  | 14.3 | 0 | 0 |

Footnote: Leukemia K562, human lung cancer NCI-H460 and colon HT29 cell lines.

The results show that 10, 11, $\mathbf{2 3}$ and $\mathbf{2 4}$ have little to no inhibition on the three studied cancer cell lines. Biological studies of $\mathbf{1}$ performed at the Biochemistry Department of the Chemistry University of Barcelona revealed that the $\mathrm{IC}_{50}$ of the benzodioxintetrahydroisoquinoline 1 on the $\mathrm{NCI}-\mathrm{H} 460$ cell line is $0.2 \mu \mathrm{M}$ in 72 h for $10 \mu \mathrm{M}$ (Table 19).

Table 19. IC 50 of the benzodioxin-tetrahydroisoquinoline 1

| Product: |  |
| :---: | :---: |
| Time (hours) | $\mathrm{IC}_{50}(\mu \mathrm{M})$ |
| 24 | 0.8 |
| 48 | 0.7 |
| 72 | 0.2 |

The S.A.R between 10 and $\mathbf{1}$ shows that the dimethoxy groups result in a decrease of biological activity compared to the benzodioxin moiety. The S.A.R between $\mathbf{1 0}$ and $\mathbf{1 1}$ reveals that a diol side chain results in an increase of antitumour activity compared to a terminal alcohol side chain.

### 4.2. Complementary biological assays: Diabetes, neurological disorders and other biological trials

### 4.2.1. Diabetes biological trials

### 4.2.1.1. Introduction

### 4.2.1.1.1. GLP-1 Secretion

Glucagon-like peptide 1 (GLP-1) is derived from transcription of the proglucagon gene followed by post-translational modifications of proglucagon of the following biologically active peptides: GLP-1 (7-37) and GLP-1 (7-36) NH2. GLP-1 secretion by ileal $L$ cells is dependent on the presence of nutrients in the small intestine. GPL-1 is a potent anti-hyperglycemic hormone inducing glucose-dependent insulin secretion and suppressing glucagon secretion. The glucose dependency of this mechanism is particularly important because GLP-1 does not stimulate insulin secretion and cause hypoglycemia when plasma glucose concentrations are in the normal fasting range. ${ }^{111}$

The GLP-1 secretion diabetes phenotypic module identifies compounds that stimulate secretion of glucagon-like peptide one (GLP-1) in mouse and human cell lines derived

[^49]from gastrointestinal tract tissue. GLP-1 secretion is measured using a Lilly proprietary ELISA assay that was specifically designed to detect the appropriate forms of GLP-1 secreted from these cells. If active in the cell-based GLP-1 assay, molecules will be further tested for selectivity in assays that measure activation of GPCRs known to stimulate GLP-1 secretion.

### 4.2.1.1.2. GPR 119 Receptor Agonist

GPR119 belongs to a family of G protein-coupled receptors. Activation of GPR119 produces an increase in cycline adenosine monophosphate (cAMP) levels. GPR119 has a limited tissue distribution, and is expressed only in pancreas and intestine. In pancreas, activation of GPR119 has a limited tissue distribution, and is expressed only in pancreas and intestine. In pancreas, activation of GPR119 results in a potentiation of glucose-induced insulin secretion. In gastrointestinal tract, activation of the receptor increases secretion of incretin (group of gastrointestinal hormones that increase the amount of insulin). Thus, GPR119 agonists might exert a dual control of glucose homeostasis. ${ }^{112}$

The GPR119 module tests for compounds that increase intracellular cAMP levels in cells expressing human GPR119 receptor. The active molecules will be further characterized for their specificity, ability to activate the mouse rodent GPR119 receptor and to increase glucagon like peptide 1 (GLP-1) secretion in murine enteroendocrine cells. Compounds of interest selectively activate GPR119 receptors and increase GLP-1 secretion. These compounds could be used as a new treatment for obesity and diabetes. ${ }^{113}$

[^50]
### 4.2.1.2. Diabetes biological activities of the tested compounds

### 4.2.1.2.1. Diabetes biological activities of the tetrahydroisoquinoline compounds (Table 20)

Table 20. Diabetes biological activity of the tetraisoquinoline analogues

|  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { u } \\ & \underset{i}{\prime} \end{aligned}$ | $\begin{gathered} \hline \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 0.7 | 2.9 | 0 | 1.2 | 1.5 |
|  |  | $\begin{aligned} & \text { \% Stim } \\ & 20 \mu \mathrm{M} \end{aligned}$ | 3.4 | 3.8 | 2.6 | 1 | 0 |
|  | 00 7 7 7 0 0 0 | $\begin{aligned} & \% \text { Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 0 | 0 | 0 | 0 | 0 |
|  |  | $\begin{gathered} \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 0.7 | 0 | 3.1 | 0 | 4.8 |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 0 | 1.8 | 3.1 | 0 | 1.0 |

The results show that the tested tetrahydroisoquinoline analogues have no significant diabetes activities.

### 4.2.1.2.2. Diabetes biological activities of the combretastatin and the dioxancarbazole analogues (Table 21)

Table 21. Diabetes biological activity of the combretastatin and the dioxancarbazole analogues

|  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} u \\ \stackrel{0}{n} \\ \underset{a}{c} \end{gathered}$ | $\begin{gathered} \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 0 | 1.7 | 2 | 0 |
|  | $\frac{\mathrm{U}}{\mathbf{U}}$ | $\begin{aligned} & \text { \% Stim } \\ & 20 \mu \mathrm{M} \end{aligned}$ | 0 | 3.2 | 2.1 | 0 |
|  | $\begin{aligned} & \text { no } \\ & \stackrel{0}{7} \\ & \underset{\sim}{c} \\ & 0 \\ & \hline \end{aligned}$ | $\begin{gathered} \% \text { Stim } \\ 10 \mu \mathrm{M} \end{gathered}$ | 0 | 0 | 0 | 0 |
|  |  | $\begin{gathered} \% \text { Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 0 | 1 | 0 | 0.8 |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 0 | 0.1 | 0 | 1.8 |

The results reveal that the tested combretastatin and dioxancarbazole analogues have no significant diabetes activities.

### 4.2.1.2.3. Diabetes biological activities of the resveratrol analogues <br> (Table 22)

Table 22. Diabetes biological activity of the resveratrol analogues

|  |  |  | $\underbrace{}_{23}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\underset{\sim}{\ddot{n}}$ | $\begin{gathered} \% \text { Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 3.1 | 0.7 | 1.7 | 0 |
|  |  | $\begin{aligned} & \text { \% Stim } \\ & 20 \mu \mathrm{M} \end{aligned}$ | 0 | 1.3 | 2 | 2.2 |
| $\begin{aligned} & \stackrel{\rightharpoonup}{0} \\ & \stackrel{\rightharpoonup}{\stackrel{1}{0}} \\ & \stackrel{0}{\Omega} \\ & \underset{\sim}{7} \\ & \underset{0}{0} \end{aligned}$ | $\begin{aligned} & 00 \\ & \frac{00}{7} \\ & \text { x } \\ & 0 \\ & 0 \end{aligned}$ | $\begin{aligned} & \% \text { Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 0 | 0 | 0 | 0 |
|  |  | $\begin{gathered} \text { \% Stim } \\ 2 \mu \mathrm{M} \end{gathered}$ | 1.7 | 0 | 0.2 | 0 |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 10 \mu \mathrm{M} \end{aligned}$ | 2.2 | 0 | 0 | 0.5 |

The results show that the tested resveratrol analogues have no significant diabetes activities.

### 4.2.2. Neurological disorder biological assays

### 4.2.2.1. Introduction

### 4.2.2.1.1. Calcitonin Gene-Related Peptide (CGRP) receptor Antagonist

CGRP is a 37 amino acid neuropeptide that plays a key role in the patho-physioloy of migraine. CGRP levels in venous plasma have been reported to be elevated during a migraine attack and are normalized after successful treatment of the migraine with a triptan (Goadsby \& Edvinsson, 1994). Infusion of CGRP into individuals with a past history of migraine attacks can induce an attack, and CGRP receptor antagonists have successfully treated migraine attacks. As such, we are interested in the identification of novel, non-peptide CGRP receptor antagonists for the treatment of migraine attacks and other disorders. ${ }^{114}$

The CGRP cAMP assay tests compounds that inhibit the activation of the CGRP receptor and the resulting generation of CAMP by CGRP. The active molecules will be further characterized for their ability to inhibit the activity of the hormones calcitonin and amylin and the peptide adrenomedullin at receptors that respond to these molecules. Compounds of interest will selectively block the CGRP receptor and not have a biological effect at the calcitonin, amylin or adrenomedullin receptors.

### 4.2.2.1.2. MGlu2R Receptor Allosteric Antagonist

Glutamate is the major excitatory neurotransmitter in the mammalian CNS, acting at both ligand gated ion channels and G-protein coupled receptors, the latter known as metabotropic glutamate receptors (mGluR). It has been postulated that antagonists of the group II subclass of metabotropic glutamate receptors (mGlu2 and mGlu3) would be useful in certain neurological and psychiatric indications. The identification of small molecule competitive and allosteric antagonists of these receptors has been a longstanding goal toward novel therapeutic agents. ${ }^{115}$

[^51]We seek to identify small molecule (MW < 500) negative allosteric modulators (NAMs, aka allostreric antagonists) for mGlu2R for the above mentioned uses. We desire compounds that are orally bioavailable with a suitable solubility.

### 4.2.2.2. Neurologic biological activity of the tested compounds

### 4.2.2.2.1. Neurologic biological activity of the tetrahydroisoquinoline analogues (Table 23)

Table 23. Neurologic biological activity of the tetrahydroisoquinoline analogues

|  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \% inhib <br> $50 \mu \mathrm{M}$ | 4.9 | 5.5 | 11.1 | 14.6 | 2.7 |
|  |  | \% inhib <br> $30 \mu \mathrm{M}$ | 0 | 0 | 0 | 0 | 9.7 |

The results show that the tested tetrahydroisoquinoline analogues have very little mGluR and CGRP biological activity.

### 4.2.2.2.2. Neurologic activity of the combretastatin and the dioxancarbazoles analogues (Table 24)

Table 24. Neurologic biological activity of the dioxancarbazole analogues

|  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \% \text { inhib } \\ & 50 \mu \mathrm{M} \end{aligned}$ | 8.6 | 4.9 | 19.2 | 22.3 |
|  |  | \%inhib <br> $30 \mu \mathrm{M}$ | 0 | 0 | 0 | 0 |

The results reveal that the dioxancarbazole analogues $\mathbf{2 1}$ and $\mathbf{2 2}$ have a low mGluR and CGRP activity. However, the tested combretastatin analogues have no significant mGluR and CGRP biological activity.

### 4.2.2.2.3. Neurologic biological activity of the resveratrol analogues (table 25)

Table 25. Neurologic biological activity of the resveratrol analogues

The results show that the resversatrol analogues $\mathbf{2 5}$ and $\mathbf{2 6}$ present a moderate mGluR biological activity. $\mathbf{2 5}$ Also possesses a low CGRP activity. However, the compounds $\mathbf{2 3}$ and $\mathbf{2 4}$ present no mGluR and CGRP biological activity.

### 4.2.3. Complementary biological activity assays of the tetrahydroisoquinoline analogues

### 4.2.3.1. Introduction

### 4.2.3.1.1. Apelin Receptor (APJ) Agonist

The Apelin Receptor (APJ) agonist module tests for compounds that activate the G protein coupled receptors APJ. Apelin has been implicated in varied biological processes such as angiogenesis, blood pressure regulation, feeding behavior, and HIV entry. APJ activation is determined by the inhibition of forskolin stimulated cAMP in cells expressing human APJ (Forskolin is a labdane diterpene commonly used to raise levels of cAMP in the study and research of cell physiology). APJ activation is
confirmed by the lack of inhibition of forskolin stimulated cAMP in mock transfected cells. ${ }^{116}$

### 4.2.3.1.2. Hexokinase 2 inhibitors

The hexakinase is an enzyme that phorphorylates hexoses. Glucose is the most important substrate of hexokinases, and glucose-6-phosphate is the most important product formed (Scheme 72).

Scheme 72. Hexokinase-mediated phosphorylation of glucose.

Hexokinase II constitutes the principal isoform and is present in higher quantities in cancer diseases ${ }^{117}$.

### 4.2.3.2. APJ and hexokinase biological activity of the tetrahydroisoquinoline analogues (table 26)

Table 26. APJ and hexokinase biological activity of the tetrahydroisoquinoline analogues

|  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 30 \mu \mathrm{M} \end{aligned}$ | 3.5 | 20.2 | 8.2 | 11.6 | 0 |
|  |  | \% inhib <br> $20 \mu \mathrm{M}$ | 0 | 28.7 | 0 | 23.6 | 23.2 |

[^52]The results show that the tetrahydroisoquinoline analogues present a low APJ activity, compound $\mathbf{4}$ being the most active. Moreover, compounds 4,8 and 9 possess a low hexokinase 2 inhibition.

### 4.2.3.3. APJ and hexokinase biological activity of the combretastatin and the dioxancarbazole analogues (Table 27)

Table 27. APJ and hexokinase biological activity of the combretastatin and the dioxancarbazole analogues

|  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 30 \mu \mathrm{M} \end{aligned}$ | 0 | 13.7 | 7.5 | 2.4 |
|  |  | $\begin{gathered} \% \text { inhib } \\ 20 \mu \mathrm{M} \end{gathered}$ | 9.5 | 5.2 | 22.5 | 0 |

The results show that only the combretastatin analogues presents a low APJ activity of 13.7\% inhibition. Moreover, compound 21 possesses a significant hexokinase 2 inhibition of $22.5 \%$.

### 4.2.3.4. APJ and hexokinase biological activity of the resveratrol analogues (table 28)

Table 28. APJ and hexokinase biological activity of the resveratrol analogues

|  |  |  | $\underbrace{20}_{23}$ |  | $\underbrace{\text { Bnochen }}_{25}$ | $\underbrace{}_{26}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \% \text { Stim } \\ & 30 \mu \mathrm{M} \end{aligned}$ | 0 | 0 | 0 | 2.4 |
|  |  | \% inhib <br> $20 \mu \mathrm{M}$ | 11.8 | 22.3 | 15.3 | 0 |

The results show that the resveratrol analogues studied don't have a significant APJ activity. presents a low APJ activity. However, compounds 23, $\mathbf{2 4}$ and $\mathbf{2 5}$ present a low hexokinase 2 inhibition.

## Safety procedures:

The experimenter has to be aware of the risks of the equipment he uses. Before any experiment, the experimenter has to write in his lab book the experiment number, the date, the reaction scheme and the quantity of reagents he will be using.

## Control Measures:

All experiments are to be carried out in a fume cupboard. Gloves, coat and lab spectacles are to be worn at all times. Inhalations of chemicals and skin or eye contact are to be avoided.

## Emergency procedure:

In case of skin/eye contact, rinse immediately with plenty of water and seek medical attention. If feeling unwell, seek medical attention. In case of solvent spillage clean up with paper towels and leave to evaporate at the back of the fume hood. Reagent spillage has to be cleaned with paper towels and disposed of via the safety office.

## Waste disposal:

Flammable waste has to be disposed of via the flammable waste stream. Special chemical waste has to be put in separated bottle for special disposal

## General experimental:

Melting points were obtained on an MFB-595010M Gallenkamp apparatus in open capillary tubes and are uncorrected. IR spectra were obtained using an FTIR PerkinElmer 1600 Infrared Spectrophotometer. Only noteworthy IR absorptions are listed $\left(\mathrm{cm}^{-1}\right)^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Gemini-200 (200 and 50.3 MHz , respectively) or Varian Gemini-300 ( 300 and 75.5 MHz ) Instrument using $\mathrm{CDCl}_{3}$ as solvent with tetramethylsilane as internal standard. Mass spectra were recorded on a Hewlett-Packard 5988-A. Column chromatography was performed with silica gel (E. Merck, 40-60 $\mu \mathrm{m}$ ) or aluminium oxide ( E . Merck, 90 standardized). Reactions were monitored by TLC using 0.25 mm silica gel F-254 (E. Merck). pH were measured with a universal pH paper indicator (Merck, pH 1-10). All reagents were of commercial quality or were purified before use according to the literature procedure. Organic solvents were of analytical grade or were purified by standard procedures. Commercial products were purchased from Sigma-Aldrich.

## 2-[6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-g]isoquinolin-7-

 yl)] ethanol (1)

The tetrahydroisoquinoline $3(150 \mathrm{mg}, 0.42 \mathrm{mmol})$ was dissolved in DMF ( 7 mL ) and put in a flame-dried round-bottom flask under argon. 2-Chloroethanol ( $0.11 \mathrm{~mL}, 1.66$ $\mathrm{mmol}), \mathrm{KI}$ (cat) and $\mathrm{Et}_{3} \mathrm{~N}(0.47 \mathrm{~mL}, 3.36 \mathrm{mmol})$ were added under argon. The reaction was stirred at rt and 2-Chloroethanol ( $0.11 \mathrm{~mL}, 1.66 \mathrm{mmol}$ ) and KI (cat) were added every day under argon for 7 days. Then, TLC of the crude mixture (EtOAc/MeOH 9:1) indicated formation of a product ( $R_{f} 0.50$ ) and complete consumption of $S M\left(R_{f} 0.15\right)$. Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( 3 x $20 \mathrm{~mL})$. The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 3:7) to afford the 2 -substitued ethanol 1 ( $54 \mathrm{mg}, 32 \%$ yield) as a white solid.

Product aspect: white solid.
Theoretical mass: 168 mg .
Mass obtained: 54 mg .
Yield: 32\%.

## Analytical data:

Compound 1

MS (EI) (m/z, \%): $401\left(\mathrm{M}^{+}, 6\right), 370\left(\mathrm{M}^{+}-\mathrm{CH}_{2} \mathrm{OH}, 100\right), 234\left(\mathrm{M}^{+}-\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{O}_{3}, 78\right)$.
( $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{O}_{3}=3,4,5$-trimethoxyphenyl).

## (6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro-[1,4]dioxino[2,3-g]isoquinolin-7yl) 2,2,2-trifluoroacetyl (2)

To a solution of 2-(2,3-dihydrobenzo[b][1,4]dioxin-6-yl)ethylamine 28 (250 mg, 1.39 $\mathrm{mmol})$ in ethanol ( 20 mL ) was added $\mathrm{HCl}(0,1 \mathrm{~mL})$, molecular sieves ( 50 mg ) and 3,4,5trimethoxybenzaldehyde 29 ( $410 \mathrm{mg}, 2.09 \mathrm{mmol}$ ) in a flame-dried round-bottom flask under argon. $\mathrm{Et}_{3} \mathrm{~N}$ was added until pH 6-6.5 was reached and the mixture was refluxed under stirring for 16 h . The mixture was concentrated in vacuo and the residue was dissolved in EtOAc ( 20 mL ), washed with $\mathrm{NaOH}(3 \times 20 \mathrm{~mL}$ of a 2 N solution), filtered and concentrated in vacuo to afford a brown oil. $\mathrm{CF}_{3} \mathrm{COOH}$ ( 3 mL , excess amount) and $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}(3 \mathrm{~mL}$, excess amount) were added and the crude mixture was refluxed under stirring for 16 h . Then, TLC of the crude mixture (EtOAc/hexane 1:1) indicated presence of a new compound ( $R_{f} 0.75$ ) and uncomplete consumption of the 3,4,5trimethoxybenzaldehyde (Rf 0.80). The mixture was dissolved in EtOAc ( 20 mL ), washed with NaOH ( $3 \times 30 \mathrm{~mL}$ of a 2 N solution), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 7:3) to afford the desired isoquinoline 2 ( $102 \mathrm{mg}, 16 \%$ yield) as a brown oil.

Product aspect: brown oil.
Theoretical mass: 638 mg .
Mass obtained: 102 mg .
Yield: 16\%.

## 6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-g]isoquinoline (3) (alternative synthesis)

The phenethylamine 28 ( $228 \mathrm{mg}, 0.84 \mathrm{mmol}$ ) and 3,4,5-trimethoxybenzaldehyde (29) ( $274 \mathrm{mg}, 0.92 \mathrm{mmol}$ ) were dissolved in benzene ( 15 mL ) in a flame-dried round-bottom flask under argon. The reaction mixture was refluxed under stirring in a Dean Stark reaction for 4 h . The solution was cooled at $0{ }^{\circ} \mathrm{C}$ and $\mathrm{H}_{3} \mathrm{PO}_{4}(2 \mathrm{~mL}$ of a $85 \%$ aqueous solution) was added. The reaction mixture was refluxed under stirring in a Dean Stark reaction for 3 h and TLC of the crude mixture (EtOAc) indicated presence of the tetrahydroisoquinoline desired product ( $R_{f} 0.30$ ) and uncomplete consumption of the aldehyde ( $\mathrm{R}_{\mathrm{f}} 0.80$ ). The reaction mixture was cooled at $0^{\circ} \mathrm{C}$ and quenched with NaOH ( 5 mL of a 2 N aqueous solution). The mixture was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL}$ ), washed with $\mathrm{NaOH} 2 \mathrm{~N}(3 \times 30 \mathrm{~mL})$ and the organic phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20$ $\mathrm{mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 3:7) to afford the tetrahydroisoquinoline 3 ( $100 \mathrm{mg}, 20 \%$ yield) as a brown solid. The reaction was scaled up using 2 g of phenethylamine 28 to afford $\mathbf{3}$ ( $1.4 \mathrm{~g}, 32 \%$ yield) as a brown solid.

Product aspect: brown solid.
Theoretical mass: 4.4 g .
Mass obtained: 1.4 g .
Yield: 32\%.

Analytical data was identical with the previously described compound.

## 2-(6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-g]isoquinolin-7-

 yl)acetonitrile (4)

The isoquinoline $\mathbf{3}$ ( $150 \mathrm{mg}, 0.42 \mathrm{mmol}$ ) was dissolved in DMF ( 10 mL ) in a flame-dried round-bottom flask under argon. Chloroacetonitrile ( $0.08 \mathrm{~mL}, 1.26 \mathrm{mmol}$ ), KI (cat) and $\mathrm{K}_{2} \mathrm{CO}_{3}(290 \mathrm{mg}, 2.1 \mathrm{mmol})$ were added under argon. The reaction was stirred at rt and chloroacetonitrile ( $0.08 \mathrm{~mL}, 1.26 \mathrm{mmol}$ ) and KI (cat) were added every day under argon for 6 days. Then, TLC of the crude mixture (EtOAc) showed formation of a new compound ( $R_{f} 0.85$ ) and complete consumption of the starting compound ( $R_{f} 0.10$ ). Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( 3 x 20 mL ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 1:1) to afford the desired compound 4 ( $140 \mathrm{mg}, 84 \%$ yield) as a brown solid.

Product aspect: brown solid.
Theoretical mass: 167 mg .
Mass obtained: 140 mg .
Yield: 84\%.

## 2-(6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-g]isoquinolin-7-

 yl)ethylamine (5)

The isoquinoline 4 ( $115 \mathrm{mg}, 0.29 \mathrm{mmol}$ ) was dissolved in THF ( 10 mL ) in a flame-dried round-bottom flask under argon, and $\mathrm{LiAlH}_{4}(35 \mathrm{mg}, 0.86 \mathrm{mmol})$ was added. The reaction was stirred at rt for 16 h and TLC of the crude mixture (EtOAc/MeOH, 7:3) showed formation of a new compound ( $\mathrm{R}_{\mathrm{f}} 0.25$ ) and complete consumption of SM (0.95). The crude mixture was quenched dropwise with water and filtered. The solid residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (EtOAc/MeOH, 2:8) to afford the isoquinoline 5 (60 $\mathrm{mg}, 52 \%$ yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 115 mg .
Mass obtained: 60 mg .
Yield: 52 \%.

## 6-(3,4,5-Trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-g]isoquinolin-7-yl) ethylamine (6)

The tetrahydroisoquinoline $\mathbf{3}(100 \mathrm{mg}, 0.28 \mathrm{mmol})$ was dissolved in DMF ( 10 mL ) in a flame-dried round-bottom flask under argon. 2-Dimethylaminoethyl chloride (121 mg, 0.84 mmol ), KI (cat) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $193 \mathrm{mg}, 1.4 \mathrm{mmol}$ ) were added under argon. The reaction was stirred at rt and 2-dimethylaminoethyl chloride ( $121 \mathrm{mg}, 0.84 \mathrm{mmol}$ ) and KI (cat) were added every day under argon for 7 days. Then, TLC of the reaction mixture (EtOAc/MeOH 7:3) showed formation of a new compound ( $\mathrm{R}_{\mathrm{f}} 0.25$ ) and uncomplete consumption of the starting compound ( $R_{f} 0.75$ ). Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by flash column chromatography (EtOAc/MeOH, 8:2) to afford the substituted isoquinoline 6 ( $10 \mathrm{mg}, 8 \%$ yield) as a yellow oil. The reaction was repeated with 300 mg of SM to afford the substituted isoquinoline 6 ( $20 \mathrm{mg}, 5 \%$ yield) as a yellow oil.

Product aspect: yellow oil.
Theoretical mass: 120 mg .
Mass obtained: 10 mg .
Yield: 8\%.

## N-(3,3-(Diethoxy)propyl)-6-(3,4,5-trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4] dioxino[2,3-g]isoquinoline (7)

The isoquinoline $\mathbf{3}$ ( $200 \mathrm{mg}, 0.56 \mathrm{mmol}$ ) was dissolved in DMF ( 5 mL ) in a flame-dried round-bottom flask under argon. 3-Chloropropionaldehydediethylacetal ( $0.14 \mathrm{~mL}, 0.84$ $\mathrm{mmol}), \mathrm{KI}$ (cat) and $\mathrm{Et}_{3} \mathrm{~N}(0.31 \mathrm{~mL}, 2.24 \mathrm{mmol})$ were added under argon. The reaction was stirred at $80-90^{\circ} \mathrm{C}$ and chloropropionaldehydediethylacetal ( $0.14 \mathrm{~mL}, 0.84 \mathrm{mmol}$ ) and KI (cat) were added every day under argon for 5 days. Then, TLC of the crude mixture (EtOAc) showed formation of a new product ( $R_{f} 0.80$ ) and complete consumption of the starting material ( $\mathrm{R}_{\mathrm{f}} 0.10$ ). Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford the desired acetal $\mathbf{7}(40 \mathrm{mg}, 15 \%$ yield) as a white oil.

Product aspect: white oil.
Theoretical mass: 267 mg .
Mass obtained: 40 mg .
Yield: 15\%.

## 3-(6,7-Dimethoxy-1-(3,4,5-trimethoxyphenyl)isoquinolin-2-yl)-1,2-propanediol (11)

The substituted isoquinoline $52(100 \mathrm{mg}, 0.24 \mathrm{mmol})$ was dissolved in 1,4 dioxane ( 10 $\mathrm{mL})$. $\mathrm{NaOH} 2 \mathrm{~N}(25 \mathrm{~mL})$ was added and the reaction was stirred for 2 days. TLC of the reaction mixture (EtOAc/MeOH 8:2) showed complete consumption of $S M\left(R_{f} 0.95\right)$ and formation of a new compound ( $R_{f} 0.60$ ). The crude mixture was evaporated in vacuo. The residue was dissolved in a mixture of diethyl ether ( 20 mL ) and EtOAc (20 $\mathrm{mL})$ and washed with water $(3 \times 20 \mathrm{~mL})$. The organic phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford the desired diol 11 ( $12 \mathrm{mg}, 11 \%$ yield) as a brown solid. The reaction was repeated using 69 mg of isoquinoline 52 to afford the desired diol 11 ( $36 \mathrm{mg}, 48 \%$ yield) as a brown solid.

Product aspect: brown solid.
Theoretical mass: 75 mg .
Mass obtained: 36 mg .
Yield: 48\%.

## 3-(4-(Benzyloxy)-3-methoxyphenyl)-4-(3,4,5-trimethoxyphenyl)-1H-pyrrole-2,5-dione

 (14)

The anhydride 76 ( $260 \mathrm{mg}, 0.55 \mathrm{mmol}$ ) was dissolved in DMF ( 5 mL ) in a flame-dried round-bottom flask under argon. $\mathrm{NH}_{4} \mathrm{OH}$ ( 0.8 mL of a $25 \%$ aqueous solution, 11 mmol ), $\mathrm{NH}_{4} \mathrm{Cl}(290 \mathrm{mg}, 5.5 \mathrm{mmol})$ and $\mathrm{NH}_{4} \mathrm{OAc}(419 \mathrm{mg}, 5.5 \mathrm{mmol})$ were added to the solution. The reaction was heated at $125{ }^{\circ} \mathrm{C}$ for 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a bright yellow compound ( $R_{f} 0.50$ ) and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.60$ ). Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc 2:8) to afford the desired imide $\mathbf{1 4}$ ( $108 \mathrm{mg}, \mathbf{4 2 \%}$ yield) as an orange solid.

Product aspect: orange solid.
Theoretical mass: 260 mg .
Mass obtained: 108 mg .
Yield: 42\%.

## 3,6-Dihydro-2H-[1,4]dioxino[2,3-b]carbazol-10-yl)methyl(3-nitrophenyl)carbamate

(22)

To the alcohol $80(67 \mathrm{mg}, 0.26 \mathrm{mmol})$ dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added 3nitroaniline 87 ( $43 \mathrm{mg}, 0.26 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(36 \mu \mathrm{~L}, 0.26 \mathrm{mmol})$ in a flame-dried roundbottom flask under argon. The reaction was stirred at rt for 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f} 0.80$ ) and complete consumption of the starting material $\mathbf{8 0}\left(R_{f} 0.40\right)$. The reaction mixture was washed with water $(2 \times 20 \mathrm{~mL})$ and $\mathrm{HCl} 1 \mathrm{~N}(2 \times 20 \mathrm{~mL})$ and the aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by aluminium oxide flash column chromatography (hexane/EtOAc 7:3) to afford the desired compound $\mathbf{2 2}$ ( $90 \mathrm{mg}, 78 \%$ yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 115 mg .
Mass obtained: 90 mg .
Yield: 78\%.

## 2-(3,4,5-Trihydroxyphenyl)-6-hydroxybenzofuran (23)

6-Hydroxy-2-(3,4,5-trimethoxyphenyl) isobenzofuran (24) ( $60 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) was dissolved in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ in a flame-dried round-bottom flask under argon. The reaction was cooled at $-30^{\circ} \mathrm{C}$ and $\mathrm{BBr}_{3}$ ( 0.4 mL of a $99 \%$ solution, 4.2 mmol ) was added. The reaction was stirred for 10 min at $-30^{\circ} \mathrm{C}$ and allowed to warm at rt for 3 h . Then, TLC of the reaction mixture (hexane/EtOAc 2:1) indicated formation of a new compound ( $R_{f} 0.10$ ) and complete consumption of starting material $\left(R_{f} 0.35\right)$. The crude mixture was cooled down to $0{ }^{\circ} \mathrm{C}$ and water ( 30 mL ) was added dropwise. The solution was let to stir at rt for 10 min . Then, NaOH 5 N was added until pH 10 and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. Finally, HCl 5 N was added until pH 1 and the aqueous phase was extracted with EtOAc ( $3 \times 30 \mathrm{~mL}$ ). The combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and concentrated in vacuo to afford the desired compound 23 (32 $\mathrm{mg}, 62 \%$ yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 52 mg .
Mass obtained: 32 mg .
Yield: 62\%.

## 6-Hydroxy-2-(3,4,5-trimethoxyphenyl) isobenzofuran (24)

7-Hydroxy-3-(3,4,5-trimethoxyphenyl)chromen-2-one (105) ( $150 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) was dissolved in ethanol ( 30 mL ) and $\mathrm{HCl} 2 \mathrm{~N}(120 \mathrm{~mL})$ was added. The reaction was refluxed under stirring for 16 h and TLC of the crude mixture (hexane/EtOAc 2:1) indicated formation of a new compound ( $R_{f} 0.35$ ) and complete consumption of starting material ( $R_{f} 0.20$ ). The ethanol was evaporated in vacuo and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 2:1) to afford the desired compound 24 ( $25 \mathrm{mg}, 18 \%$ yield) as a white solid. The reaction was scaled up using 660 mg of 7-hydroxy-3-(3,4,5-trimethoxyphenyl)-chromen-2-one (105) to obtain 24 (174 mg, 29\% yield) as a white solid.

Product aspect: white solid.
Theoretical mass: 601 mg .
Mass obtained: 174 mg.
Yield: 29\%.

## 6-(Benzyl)-2-(2,5-dimethoxyphenyl)indole (25)

3-Benzoxyaniline 113 ( $2.3 \mathrm{~g}, 6.95 \mathrm{mmol}$ ) was dissolved in $\mathrm{N}, \mathrm{N}$-dimethylaniline ( 25 mL ) in a flame-dried round-bottom flask under argon. The reaction was heated to $150^{\circ} \mathrm{C}$ and $2^{\prime}$-bromo-2,5-dimethoxyacetophenone (113) ( $1 \mathrm{~g}, 2.32 \mathrm{mmol}$ ) was added and the reaction was heated at $165{ }^{\circ} \mathrm{C}$ for 1 h . Then, TLC of the crude mixture (hexane/EtOAc $8: 2$ ) indicated formation of a new compound ( $R_{f} 0.45$ ) and complete consumption of starting materials ( $R_{f} 0.25, R_{f} 0.10$ ). The crude mixture was dissolved in EtOAc ( 50 mL ), washed with $\mathrm{HCl} 2 \mathrm{~N}(4 \times 50 \mathrm{~mL})$ and the aqueous phase were re-extracted with EtOAc $(3 \times 30 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by aluminium oxide flash column chromatography (hexane/EtOAc 8:2). The residue was recristalised (hexane/EtOAc 8:2) to afford (6-benzyl)-2-(2,5-dimethoxyphenyl)indole (25) ( $740 \mathrm{mg}, 53 \%$ yield) as a white solid. The product is unstable and must be put in the fridge and protected from the light.

Product aspect: white solid.
Theoretical mass: 1.39 g .
Mass obtained: 740 mg .
Yield: 53\%.

## 2-(2,3-Dihydro[1,4]benzodioxin-6-yl)ethylamine (28) (alternative synthesis)

(E)-6-(2-Nitrovinyl)-2,3-dihydro[1,4]benzodioxine (36) (1.6 g, 7.68 mmol ) was dissolved in EtOAc (80 mL) and MeOH (5 mL). 10\% Palladium on charcoal catalyst ( $268 \mathrm{mg}, 10 \%$ $\mathrm{w} / \mathrm{w}$ ) was added and the mixture was put under a 7 atm hydrogen atmosphere under stirring for 2 days. After 16 h, TLC of the crude mixture (hexane/EtOAc) indicated formation of a new compound and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}}$ 0.80). The mixture was filtered and concentrated in vacuo to afford 28 (852 mg, 53\% yield) as a brown oil.

Product aspect: Brown oil.
Theoretical mass: 1.60 g .
Mass obtained: 852 mg .
Yield: 53\%.

Analytical data was identical with the previously described compound.

## 2-(2,3-Dihydro[1,4]benzodioxin-6-yl)ethylamine (28) (alternative synthesis)

6-(2-Chloroethyl)-2,3-dihydrobenzo[1,4]dioxine (33) (200 mg, 1.01 mmol ) was dissolved in EtOAc ( 80 mL ) and $\mathrm{MeOH}(5 \mathrm{~mL}) .10 \%$ Palladium on charcoal catalyst (268 $\mathrm{mg})$ and $\mathrm{HCl}(30 \mu \mathrm{~L})$ were added and the mixture was put under hydrogen atmosphere under stirring for 2 days. Then, TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound and complete consumption of the starting material ( $\mathrm{R}_{\mathrm{f}}$ $0.60)$. The crude mixture was concentrated in vacuo. The residue was purified by silica gel flash column chromatography to afford 2-(2,3-dihydro[1,4]benzodioxin-6yl)ethylamine (28) ( $71 \mathrm{mg}, 53 \%$ yield) as a brown oil. This material was identical in all respects with that previously described.

Product aspect: brown oil.
Theoretical mass: 133 mg .
Mass obtained: 71 mg .
Yield: 53\%.

Analytical data was identical with the previously described compound.

## 2-(2,3-Dihydro[1,4]benzodioxin-6-yl)ethylamine (28) (alternative synthesis)

1-(2,3-Dihydro[1,4]benzodioxin-6-yl)-2-nitroethanol (31) ( $554 \mathrm{mg}, 2.46 \mathrm{mmol}$ ) was dissolved in methanol ( 20 mL ). $\mathrm{HCl}(30 \mu \mathrm{~L})$ and $10 \%$ Palladium on charcoal catalyst ( $110 \mathrm{mg}, 10 \% \mathrm{w} / \mathrm{w}$ ) in EtOAc ( 5 mL ) were added. The reaction mixture was put under hydrogen atmosphere under stirring for 32 h and TLC of the crude mixture (EtOAc/hexane 7:3) indicated formation of a new compound and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.45$ ). The crude mixture was filtered and concentrated in vacuo to afford 2-(2,3-dihydro[1,4]benzodioxin-6-yl)ethylamine (28) ( $242 \mathrm{mg}, 55 \%$ yield) as a brown oil. This material was identical in all respects with that previously described.

Product aspect: brown oil.
Theoretical mass: 440 mg .
Mass obtained: 242 mg .
Yield: 55\%.

Analytical data was identical with the previously described compound.

## 2,3-Dihydro[1,4]benzodioxin-6-carbaldehyde (30)

6-Bromo-2,3-dihydro-[1,4]-benzodioxin (37) ( $500 \mathrm{mg}, 2.33 \mathrm{mmol}$ ) was dissolved in anhydrous THF ( 10 mL ) and put in a flame-dried two-neck round-bottom flask. The mixture was cooled at $-78{ }^{\circ} \mathrm{C}$ and BuLi $(0.33 \mathrm{~mL}$ of a 1.6 M solution in hexane, 3.49 mmol ) was added portionwise. After 1 h , DMF ( $0.36 \mathrm{~mL}, 4.65 \mathrm{mmol}$ ) was added. The reaction was allowed to cool at rt and stirred for 16 h . Then, TLC of the crude mixture (hexane/EtOAc 7:3) indicated formation of a major product ( $R_{f} 0.50$ ) and uncomplete consumption of starting material ( $R_{f} 0.60$ ). The reaction mixture was quenched with $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$. Water ( 20 mL ) was added and the mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford 2,3-dihydro-[1,4]-benzodioxin-6-carbaldehyde ( $\mathbf{3 0}$ ) ( $232 \mathrm{mg}, 60 \%$ yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 387 mg .
Mass obtained: 232 mg .
Yield: 60\%.

## Analytical data:

mp: $52-54{ }^{\circ} \mathrm{C}(\mathrm{MeOH})$.
$\mathbf{R}_{f}=0.50$ (hexane/EtOAc 7:3), 0.80 (hexane/EtOAc 1:1).
RMN ${ }^{1}{ }^{\mathbf{H}}\left(\mathrm{CDCl}_{3}, \mathbf{3 0 0} \mathbf{~ M H z}\right) \boldsymbol{\delta}(\mathrm{ppm}): 4.25-4.40\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}(\mathrm{x} 2)\right), 6.98(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=8.8$ $\mathrm{Hz}, \mathrm{H}-8$ ), 7.38-7.42 (m, 2H, H-5, H-7), 9.82 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{COH}$ ).

## 2,3-Dihydro[1,4]benzodioxin-6-carbaldehyde (30) (alternative synthesis)

To 3,4-dihydroxybenzaldehyde $40(2 \mathrm{~g}, 14.5 \mathrm{mmol})$ dissolved in acetone ( 30 mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(10 \mathrm{~g}, 72.4 \mathrm{mmol})$ and 1,2-dibromoethane ( $1.5 \mathrm{~mL}, 17.38 \mathrm{mmol}$ ) in a flame-dried round-bottom flask under argon. The reaction was refluxed under stirring for 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated presence of a new compound ( 0.80 ) and uncomplete consumption of starting material ( $R_{f} 0.50$ ). The reaction mixture was concentrated in vacuo. The residue was dissolved in diethyl ether $(20 \mathrm{~mL})$, washed with $\mathrm{NaOH} 2 \mathrm{~N}(3 \times 20 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to afford 2,3-dihydro[1,4]benzodioxin-6-carbaldehyde (30) ( $1 \mathrm{~g}, 42 \%$ yield) as a yellow oil. HCl 5 N was added to the aqueous phase until pH 1 and extracted with EtOAc ( 3 x 30 mL ). The combined organic phases were dried and concentrated in vacuo to afford 3, 4-dihydroxybenzaldehyde (40) ( $280 \mathrm{mg}, 14 \%$ yield) as a dark blue solid.

Product aspect: yellow oil.
Theoretical mass: 2.38 g .
Mass obtained: 1.00 g .
Yield: 42\%.
Recuperation of starting material: 14\%.

Analytical data was identical with the previously described compound.

## 2,3-Dihydro[1,4]benzodioxin-6-carbaldehyde (30) (alternative synthesis)

To 3, 4-dihydroxybenzaldehyde (40) ( $2 \mathrm{~g}, 14.5 \mathrm{mmol}$ ) dissolved in DMF ( 30 mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(4 \mathrm{~g}, 29 \mathrm{mmol})$ and 1,2-dibromoethane ( $1.5 \mathrm{~mL}, 17.38 \mathrm{mmol}$ ) in a flamedried round-bottom flask under argon. The reaction was refluxed under stirring for 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated presence of a new compound ( $R_{f} 0.80$ ) and partial consumption of starting material ( $R_{f} 0.50$ ). Water (20 mL ) was added and the crude mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford 2,3-dihydro[1,4]benzodioxin-6carbaldehyde ( $\mathbf{3 0}$ ) ( $1.54 \mathrm{~g}, 81 \%$ yield) as a yellow oil.

Product aspect: yellow oil.
Theoretical mass: 2.38 g .
Mass obtained: 1.54 g .
Yield: 65\%.

Analytical data was identical with the previously described compound.

## 1-(2,3-Dihydro[1,4]benzodioxin-6-yl)-2-nitroethanol (31)

Anhydrous THF ( 5 mL ) was put in a flame-dried two-necked round-bottom flask under argon. The mixture was cooled at $-78{ }^{\circ} \mathrm{C} . \mathrm{CH}_{3} \mathrm{NO}_{2}(0.245 \mathrm{~mL}, 4.57 \mathrm{mmol})$ and LDA ( $0.619 \mathrm{~mL}, 4.57 \mathrm{mmol}$ ) were added and the mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for $3 \mathrm{~h} .2,3-$ Dihydro[1,4]benzodioxin-6-carbaldehyde (30) ( $500 \mathrm{mg}, 3.05 \mathrm{mmol}$ ) was dissolved in anhydrous THF ( 5 mL ) in a flame-dried round-bottom flask under argon and added to the solution. The reaction was allowed to warm up at rt and stirred for 6 h . Then, TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a major product ( $R_{f}$ 0.35 ) and incomplete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.80$ ). The crude mixture was quenched with ammonium chloride ( 3 mL ). Diethyl ether ( 20 mL ) was added. The organic phase was washed with water ( $3 \times 10 \mathrm{~mL}$ ) and the combined aqueous phases were re-extracted with diethyl ether ( $3 \times 10 \mathrm{~mL}$ ). The combined organic phases were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 1:1) to afford 1-(2,3-dihydrobenzo[1,4]dioxin-6-yl)-2-nitroethanol (31) (119 mg, 18\% yield) as a yellow solid and starting material 30 ( $280 \mathrm{mg}, 56 \%$ yield). The reaction was repeated using with 500 mg of $\mathbf{3 0}$ to afford $\mathbf{3 1}$ ( $674 \mathrm{mg}, 21 \%$ yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 661 mg .
Mass obtained: 119 mg .
Yield: 18\%.

## Analytical data:

mp: $74-78^{\circ} \mathrm{C}$ (EtOAc).
$\mathbf{R}_{\mathrm{f}}=0.35$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, \mathbf{2 0 0} \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 4.26\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}(\mathrm{x} 2)\right), 4.40-4.62\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}-\right.$ $\mathrm{NO}_{2}$ ), 5.34 (dd, $J=3.6 \mathrm{~Hz}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}-\mathrm{OH}$ ), 6.83-6.88 (m, 2H, H-5, H-7), 6.90-6.93 (m, 1H, H-8).

## Ethyl 2-(2,3-dihydro[1,4]benzodioxin-6-yl)-2-oxoacetate (32)

2,3-Dihydro-1,4-benzodioxin (27) (1 g, 7.34 mmol ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ in a flame-dried round-bottom flask. The mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and ethyl oxalyl chloride ( $0.9 \mathrm{~mL}, 8.08 \mathrm{mmol}$ ) was added portionwise. $\mathrm{TiCl}_{4}(1 \mathrm{~mL})$ was added. The reaction was stirred at rt for 3 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a major product ( $\mathrm{R}_{\mathrm{f}} 0.65$ ) and complete consumption of starting material ( $R_{f} 0.75$ ). The reaction was quenched with ice and stirred for 15 min . $\mathrm{H}_{2} \mathrm{O}(20$ mL ) was added. The organic phase was washed with $\mathrm{NaOH} 5 \mathrm{~N}(3 \times 20 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford ethyl 2-(2,3-dihydro[1,4]benzodioxin-6-yl)-2-oxoacetate (32) ( 1.71 g , $98 \%$ yield) as a bright yellow solid

Product aspect: bright yellow solid.
Theoretical mass: 1.74 g .
Mass obtained: 1.71 g .
Yield: 98\%.

## Analytical data:

mp: $60-63^{\circ} \mathrm{C}$ (EtOAc).
$\mathbf{R}_{\mathrm{f}}=0.65$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 1.41\left(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{2}-\mathrm{CH}_{3}\right)$, 4.39-4.20(m, $\left.4 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}(\mathrm{x} 2)\right), 4.42\left(\mathrm{q}, \mathrm{J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{2}-\mathrm{CH}_{3}\right), 6.95(\mathrm{dd}, \mathrm{J}=1.8 \mathrm{~Hz}, \mathrm{~J}=7.5 \mathrm{~Hz}, 1 \mathrm{H}$, H-8), 7.53-7.58 (m, 2H, H-5, H-7).

## 2-(2,3-Dihydrobenzo[1,4]dioxin-6-yl)ethanol (34)

Ethyl 2-(2,3-dihydro[1,4]benzodioxin-6-yl)-2-oxoacetate (32) ( $200 \mathrm{mg}, 0.85 \mathrm{mmol}$ ) was dissolved in THF ( 20 mL ) in a flame-dried round-bottom flask under argon. $\mathrm{LiAlH}_{4}$ ( $128.54 \mathrm{mg}, 3.34 \mathrm{mmol}$ ) was added. The reaction was stirred at rt for 4 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a major product and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.65$ ). The reaction mixture was quenched with water portionwise and let to stir for 15 minutes. Diethyl ether ( 20 mL ) and water ( 20 mL ) were added. The organic phase was extracted with water ( $3 \times 10 \mathrm{~mL}$ ) and the combined aqueous phases were re-extracted with diethyl ether ( $3 \times 10 \mathrm{~mL}$ ). The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford (2,3-dihydro[1,4]benzodioxin-6-yl)ethanol 34 ( $85 \mathrm{mg}, 57 \%$ yield) as a colorless oil. The reaction was repeated using 600 mg of 32 to afford 2-(2,3-dihydrobenzo[1,4]dioxin-6-yl)ethanol (34) ( $340 \mathrm{mg}, 76 \%$ yield) as a colourless oil.

Product aspect: colorless oil.
Theoretical mass: 447 mg .
Mass obtained: 340 g .
Yield: 76\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.35$ (hexane/EtOAc 2:8).
RMN ${ }^{1} \mathbf{H}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 3.70-3.52\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{OH}\right), 4.21\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{2}-\right.$ $\mathrm{O}(\mathrm{x} 3)$, 6.93-6.79 (m, 3H, H-5, H-7, H-8).

## N-Benzyl-2-(2,3-dihydro[1,4]benzodioxin-6-yl)ethylamine (35)

6-(2-Chloroethyl)-2,3-dihydro[1,4]benzodioxine (39) (200 mg, 1.01 mmol ) was dissolved in DMF ( 50 mL ). Benzylamine ( $0.17 \mathrm{~mL}, 1.51 \mathrm{mmol}$ ) and triethylamine ( 0.21 $\mathrm{mL}, 1.51 \mathrm{mmol}$ ) were added. The reaction was heated at $90^{\circ} \mathrm{C}$ under stirring for 92 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f} 0.50$ ) and uncomplete consumption of 39 ( $R_{f} 0.60$ ). The crude mixture was quenched with ice ( 20 mL ), $\mathrm{HCl} 1 \mathrm{~N}(20 \mathrm{~mL})$ was added and the mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was microdistilled to afford $N$-benzyl-2-(2,3)-dihydro[1,4]benzodioxin-6-yl)ethylamine 35 ( $178 \mathrm{mg}, 66 \%$ yield) as a brown oil.

Product aspect: brown oil.
Theoretical mass: 270 mg .
Mass obtained: 178 mg .
Yield: 66\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.50$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathbf{H}\left(\mathrm{CDCl}_{3}, \mathbf{3 0 0} \mathrm{MHz}\right) \boldsymbol{\delta}$ (ppm): 2.18-2.50(m, $\left.2 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{Ar}\right), 3.51-3.73\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}-\right.$ $\left.\mathrm{CH}_{2}-\mathrm{NH}, \mathrm{NH}-\mathrm{CH}_{2}-\mathrm{Ar}\right), 4.22-4.26\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}(x 2)\right), 6.70-6.85(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-5, \mathrm{H}-7, \mathrm{H}-8)$, 7.18-7.40 (m, 5H, NBn).
(E)-6-(2-Nitrovinyl)-2,3-dihydro[1,4]benzodioxine (36)

2,3-Dihydro[1,4]benzodioxin-6-carbaldehyde (30) ( $1 \mathrm{~g}, 6.1 \mathrm{mmol}$ ) and ammonium acetate ( $123 \mathrm{mg}, 1.57 \mathrm{mmol}$ ) were dissolved in nitromethane ( 10 mL ) in a flame-dried round-bottom flask under argon and refluxed under stirring for 16 h . Then, TLC of the crude mixture $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ / hexane $\left.7: 3\right)$ indicated formation of a bright yellow compound ( $R_{f} 0.55$ ) and complete consumption of the starting material ( $R_{f} 0.35$ ). The crude mixture was filtered and concentrated in vacuo to afford (E)-6-(2-nitrovinyl)-2,3dihydro[1,4]benzodioxine ( 36 ) ( $1.25 \mathrm{~g}, 99 \%$ yield) as a bright yellow solid.

Product aspect: bright yellow solid.
Theoretical mass: 1.26 g .
Mass obtained: 1.25 g .
Yield: 99\%.

## Analytical data:

mp: $148-150{ }^{\circ} \mathrm{C}$ (EtOAc).

## 6-Bromo-2,3-dihydro-[1,4]-benzodioxin (37)

2,3-Dihydro-1,4 benzodioxin (27) ( $1 \mathrm{~g}, 7.34 \mathrm{mmol}$ ) was dissolved in methanol ( 10 mL ) and put in a flame-dried round-bottom flask under argon. The crude mixture was cooled to $0^{\circ} \mathrm{C}$ and N -Bromosuccinimide ( $1.58 \mathrm{~g}, 7.34 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at rt for 16 h and TLC of the crude mixture (hexane/EtOAc 7:3) indicated formation of a major product ( $\mathrm{R}_{\mathrm{f}} 0.60$ ) and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.65$ ). The reaction was concentrated in vacuo, dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with $\mathrm{NaOH}(3 \times 20 \mathrm{~mL}$ of a 5 N solution). The aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford 6-bromo-2,3-dihydro-[1,4]-benzodioxin (37) (1.3 g, 97\% yield) as a yellow solid.

Product aspect: yellow solid.
Theoretical mass: 1.34 g .
Mass obtained: 1.30 g .
Yield: 97\%.

## Analytical data:

$\mathrm{mp}: 128-132^{\circ} \mathrm{C}$ (EtOAc).
$\mathbf{R}_{\mathrm{f}}=0.55$ (hexane/EtOAc 7:3).

RMN ${ }^{13} \mathbf{C}\left(\right.$ CDCl $_{3}, \mathbf{5 0 . 3} \mathbf{~ M H z )} \boldsymbol{\delta}$ (ppm): $64.1\left(\mathrm{CH}_{2}, \mathrm{CH}_{2}-\mathrm{O}\right), 64.2\left(\mathrm{CH}_{2}, \mathrm{CH}_{2}-\mathrm{O}\right), 112.7(\mathrm{C}, \mathrm{C}-$ 6), 118.5 (CH, C-5), 120.2 (CH, C-8), 124.1 (CH, C-7), 142.8 (C, C-8a), 144.3 (C, C-4a).

## 6-(2-Chloroethyl)-2,3-dihydro[1,4]benzodioxine (39)

(2,3-Dihydro[1,4]benzodioxin-6-yl)ethanol (34) ( $300 \mathrm{mg}, 2.22 \mathrm{mmol}$ ) was dissolved in $\mathrm{SOCl}_{2}(1.5 \mathrm{~mL})$ in a flame-dried round-bottom flask under argon, heated at $110^{\circ} \mathrm{C}$ and stirred for 15 min . Then, TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $\mathrm{R}_{\mathrm{f}} 0.60$ ) and complete consumption of SM . The crude mixture was quenched with ice ( 20 mL ) and NaOH was added until pH 14 . The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo to afford 6-(2-chloroethyl)-2,3dihydro[1,4]benzodioxine (39) (338 mg, 77\% yield) as a brown oil.

Product aspect: brown oil.
Theoretical mass: 439 mg .
Mass obtained: 338 mg .
Yield: 77\%.

## Analytical data:

$\mathbf{R}_{\mathbf{f}}=0.6$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, \mathbf{3 0 0} \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 2.44\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{Cl}\right) 3.77\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{CH}_{2}\right.$ $\left.\mathrm{CH}_{2}-\mathrm{Cl}\right), 4.43\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}(\mathrm{x} 2)\right), 6.83-7.35(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-5, \mathrm{H}-7, \mathrm{H}-8)$.

## N-Ethoxycarbonyl-6-(3,4,5-trimethoxyphenyl)-2,3,6,7,8,9-hexahydro[1,4]dioxino[2,3-

 g]isoquinoline (45)

The isoquinoline $\mathbf{3}$ ( $100 \mathrm{mg}, 0.28 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ in a flamedried round-bottom flask under argon. $\mathrm{Et}_{3} \mathrm{~N}(0.06 \mathrm{~mL}, 0.42 \mathrm{mmol})$ was added and the reaction mixture was stirred for 15 min . The reaction was cooled to $0^{\circ} \mathrm{C}$ and ethyl chloroformate ( $0.04 \mathrm{~mL}, 0.42 \mathrm{mmol}$ ) was added. The reaction was stirred at rt for 3 h and TLC of the crude reaction (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f} 0.60$ ) and complete consumption of the starting material ( $R_{f} 0.05$ ). Water ( 20 mL ) was added and the crude mixture was extracted with diethyl ether ( 3 x 20 mL ). The combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(5 \times 30 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc 7:3) to afford the desired chloroformiate 45 ( 87 mg , $73 \%$ yield) as a yellow oil.

Product aspect: yellow oil.
Theoretical mass: 120 mg .
Mass obtained: 87 mg .
Yield: 73\%.

## 6,7-Dimethoxy-1-(3,4,5-trimethoxyphenyl)-1,2,3,4-tetrahydroisoquinoline (49)

The substitued isoquinoline $51(870 \mathrm{mg}, 1.91 \mathrm{mmol})$ was dissolved in $\mathrm{MeOH}(15 \mathrm{~mL})$. $\mathrm{NaOH} 2 \mathrm{~N}(45 \mathrm{~mL})$ was added and the reaction was heated to reflux for 16 h . Then, TLC of the crude mixture (hexane/EtOAc 1:1) showed total consumption of SM ( $R_{f} 0.75$ ) and formation of a new compound ( $R_{f} 0.15$ ). The methanol was evaporated in vacuo. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was purified by flash column chromatography (hexane/EtOAc 1:1) to afford the desired isoquinoline 49 ( $480 \mathrm{mg}, 70 \%$ yield) as a white solid.

Product aspect: white solid.
Theoretical mass: 683 mg .
Mass obtained: 480 mg .
Yield: 70\%.

51
$\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{~F}_{3} \mathrm{NO}_{6}$ $455,14 \mathrm{~g} / \mathrm{mol}$

The veratrolethylamine $\mathbf{5 0}(2 \mathrm{~g}, 11 \mathrm{mmol})$ and 3,4,5-trimethoxybenzaldehyde (29) (2.38 $\mathrm{g}, 12.1 \mathrm{mmol}$ ) were dissolved in toluene ( 30 mL ) in a flame-dried round-bottom flask under argon. APTS (catalytic amount) and $4 \AA$ molecular sieves ( 50 mg ) were added. The reaction mixture was refluxed under stirring for 16 h and TLC of the reaction mixture (EtOAc) indicated the presence of the aldehyde ( $R_{f} 0.80$ ) and the imine ( $R_{f}$ 0.85 ). The crude mixture was filtered to afford 5 g of a brown oil. $\mathrm{CF}_{3} \mathrm{COOH}(7 \mathrm{~mL})$ and $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}(7 \mathrm{~mL})$ were added and the mixture was stirred for 24 h . TLC of the crude mixture (EtOAc/hexane 1:1) indicated the presence of the desired compound (Rf 0.75) and complete consumption of the imine ( $R_{f} 0.85$ ). The crude reaction was dissolved in EtOAc ( 20 mL ), washed with $\mathrm{NaOH} 2 \mathrm{~N}(3 \times 30 \mathrm{~mL})$ and the combined aqueous phases were re-extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 1:1) to afford the desired compound 51 $(1.67 \mathrm{~g}, 33 \%$ yield) as a pale brown oil.

Product aspect: pale brown oil.
Theoretical mass: 5.01 g .
Mass obtained: 1.67 g .
Yield: 33\%.

## (Z)-5-(3-Benzyloxy)-4-methoxystyryl)-1,2,3-trimethoxybenzene (55a) (alternative method)

The carboxylic acid 53 ( $100 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) was dissolved in quinoline ( 5 mL ) in a flame-dried round-bottom flask under argon and Cu (cat) was added under argon. The reaction was heated at $200^{\circ} \mathrm{C}$ for 6 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of two new compounds ( $\mathrm{R}_{\mathrm{f}} 0.80,0.60$ ) and complete consumption of starting material ( $R_{f} 0.20$ ). The reaction mixture was dissolved in diethyl ether ( 20 $\mathrm{mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL}), \mathrm{NaOH} 2 \mathrm{~N}(3 \times 20 \mathrm{~mL})$ and $\mathrm{HCl} 2 \mathrm{~N}(5 \times 20 \mathrm{~mL})$. The combined aqueous phases were re-extracted with diethyl ether ( 20 mL ). The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford 55a ( $54 \mathrm{mg}, 60 \%$ yield) as a pale brown solid and 55b ( $22 \mathrm{mg}, 24 \%$ yield) as a pale brown solid.

Product aspect: pale brown solid.
Theoretical mass: 89 mg .
Mass obtained: 54 mg .
Yield: 60\%.

Analytical data was identical with the previously described compound.

## (Z)-5-(3-Benzyloxy)-4-methoxystyryl)-1,2,3-trimethoxybenzene (55a) from 55b

The olefin 55b ( $40 \mathrm{mg}, 0.13 \mathrm{mmol}$ ) was dissolved in benzene ( 5 mL ) in a flame-dried round-bottom flask under argon. Benzil ( $114 \mathrm{mg}, 0.64 \mathrm{mmol}$ ) was added. The reaction was let to stir at rt under U.V. radiation ( 254 nm ) for 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $\mathrm{R}_{\mathrm{f}} 0.80$ ) and uncomplete consumption of starting material $\mathbf{5 5 b}\left(R_{f} 0.60\right)$. The crude reaction was concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford the desired compound 55 a ( $24 \mathrm{mg}, 60 \%$ yield) as a pale brown solid and the starting material 55b ( $16 \mathrm{mg}, 40 \%$ yield) as a pale brown solid.

Product aspect: pale brown solid.
Theoretical mass: 40 mg .
Mass obtained: 24 mg .
Yield: 60\%.

Analytical data was identical with the previously described compound.

## 3-Benzyloxy-4-methoxybenzaldehyde (57)

3-Hydroxy-4-methoxybenzaldehyde (58) ( $1 \mathrm{~g}, 6.57 \mathrm{mmol}$ ) was dissolved in DMF (10 mL ) in a flame-dried round-bottom flask under argon. $\mathrm{K}_{2} \mathrm{CO}_{3}(1.27 \mathrm{~g}, 9.2 \mathrm{mmol})$ and benzyl bromide ( $1.09 \mathrm{~mL}, 9.2 \mathrm{mmol}$ ) were added under argon. The reaction was heated at $80^{\circ} \mathrm{C}$ during 16 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f} 0.75$ ) and total consumption of the starting material ( $\mathrm{R}_{\mathrm{f}} 0.40$ ). Diethyl ether ( 15 mL ) was added, the solution was washed with $\mathrm{NaOH} 2 \mathrm{~N}(3 \mathrm{x}$ 15 mL ) and water ( $4 \times 15 \mathrm{~mL}$ ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford 3-benzyloxy-4-methoxybenzaldehyde (57) ( 1.5 g , $94 \%$ yield) as a yellow solid.

Product aspect: Yellow solid.
Theoretical mass: 1.59 g .
Mass obtained: 1.50 g .
Yield: 94\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.75$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathbf{H}\left(\right.$ CDCl $\left._{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 3.96\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 5.18\left(\mathrm{~s}, \mathrm{CH}_{2}, \mathrm{CH}_{2}-\mathrm{O}\right), 6.99(\mathrm{~d}, \mathrm{~J}=$ $9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 7-30(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-2, \mathrm{H}-6), 7.50-7.43$ (m, 5H, OBn), 9.82 (s, 1H, CHO).

$$
\begin{aligned}

$$

(4-Methylsulfonyl)phenylacetic acid ( $\mathbf{6 0}$ ) ( $300 \mathrm{mg}, 1.40 \mathrm{mmol}$ ) and 3-benzyloxy-4methoxybenzaldehyde (57) ( $339 \mathrm{mg}, 1.4 \mathrm{mmol}$ ) were dissolved in acetic anhydride ( 5 mL ) in a flame-dried round-bottom flask under argon. $\mathrm{Et}_{3} \mathrm{~N}(2,5 \mathrm{~mL}$, excess amount) was added under argon. The reaction was refluxed under stirring for 6 h and TLC of the crude mixture (EtOAc) indicated formation of a new compound ( $R_{f} 0.40$ ) and uncomplete consumption of $S M\left(R_{f} 0.80,0.15\right)$. The crude mixture was cooled down to $0{ }^{\circ} \mathrm{C}$ and quenched with $\mathrm{HCl} 5 \mathrm{~N}(20 \mathrm{~mL})$. $\mathrm{NaOH} 30 \%$ was added until pH 14 and the aqueous phase was washed with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). HCl 5 N was added until pH 1 and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{NaSO}_{4}\right)$, filtered and evaporated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 4:6) to afford the carboxylic acids 59a and 59b ( $32 \mathrm{mg}, 5 \%$ yield) as a white solid, starting material 57 ( 304 mg ) and starting material 60 ( 251 mg ).

Product aspect: white solid.
Theoretical mass: 614 g .
Mass obtained: 32 mg .
Yield: 5\%.

## 2-(4-Methylthio)phenylacetic acid (61)

To the carboxylic acid (64) ( $150 \mathrm{mg}, 0.765 \mathrm{mmol}$ ) and $\mathrm{KOH}(107 \mathrm{mg}, 1.91 \mathrm{mmol})$ in diethylene glycol ( 2 mL ) was added $\mathrm{NH}_{2} \mathrm{NH}_{2} . \mathrm{H}_{2} \mathrm{O}(0.087 \mathrm{~mL}, 2.3 \mathrm{mmol})$. The reaction mixture was heated at $200^{\circ} \mathrm{C}$ for 4 h and TLC of the crude mixture (EtOAc/methanol $8: 2$ ) indicated formation of a new compound ( $R_{f} 0.65$ ) and uncomplete consumption of starting material ( $R_{f} 0.30$ ). The aqueous phase was washed with diethyl ether ( $3 \times 20$ mL ). HCl 2 N was added until pH 1 and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 $\times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to afford the desired compound $\mathbf{6 1}$ ( $109 \mathrm{mg}, 78 \%$ yield) as an orange solid.

Product aspect: orange solid.
Theoretical mass: 140 mg .
Mass obtained: 109 mg .
Yield: 78\%.

## Analytical data:

mp: $96-98^{\circ} \mathrm{C}$ (ethanol).
$\mathbf{R}_{\mathrm{f}}=0.30$ ( $\mathrm{EtOAc} / \mathrm{MeOH} 8: 2$ ).
RMN ${ }^{1} \mathrm{H}$ (Acetone-d6, 300 MHz ) $\delta(\mathrm{ppm}): 2.65\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}-\mathrm{S}\right), 3.77\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{C} \underline{H}_{2}-\mathrm{COOH}\right)$, 7.50-7.30 (m, 4H, H-2, H-3, H-5, H-6).

## Ethyl 2-(4-(methylthiophenyl)-2-oxoacetate (63)

Ethyl chlorooxoacetate ( $0.296 \mathrm{~mL}, 2.60 \mathrm{mmol}$ ) and thioanisole (62) ( $300 \mathrm{mg}, 2.42$ $\mathrm{mmol})$ were dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ in a flame-dried round-bottom flask under argon. The mixture was cooled at $0{ }^{\circ} \mathrm{C}$ and $\mathrm{TiCl}_{4}(3.5 \mathrm{~mL})$ was added. The reaction was stirred at rt for 16 h and TLC of the crude mixture (hexane/EtOAc 8:2) indicated formation of a major compound ( $\mathrm{R}_{\mathrm{f}} 0.55$ ) and uncomplete consumption of starting materials ( $R_{f} 0.80$ ). The reaction mixture was washed with water $(3 \times 20 \mathrm{~mL})$ and the aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was purified by silica gel flash column chromatography (hexane/EtOAc 9:1) to afford the desired compound 63 ( $200 \mathrm{mg}, 37 \%$ yield) as a yellow solid. The reaction was scaled up using 1 g of thioanisole (62) to afford the ketoester 63 ( $1.6 \mathrm{~g}, 50 \%$ yield) as a yellow oil.

Product aspect: yellow oil.
Theoretical mass: 3.2 g .
Mass obtained: 1.6 g .
Yield: 50\%.

## Analytical data:

mp: 82-84 ${ }^{\circ} \mathrm{C}$ (EtOAc).
$\mathbf{R}_{\mathrm{f}}=0.55$ (hexane/EtOAc 8:2).
IR (film) v cm ${ }^{-1}$ : 2918, 2848 (C-H), 1731, 1672 (C=O), 1555, 1460, 1406 (Ar-H), 1207 (SAr), 1177 (C-O).

RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 1.41\left(\mathrm{t}, \mathrm{J}=7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{O}\right), 2.53\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}-\mathrm{S}\right)$, $4.44\left(\mathrm{q}, J=7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}\right), 7.29(\mathrm{~d}, J=9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-2, \mathrm{H}-6), 7.92(\mathrm{~d}, J=9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-3, \mathrm{H}-$ 5).

## 2-(4-Methylthio)phenyl)-2-oxoacetic acid (64)

The ethyl ester 63 ( $100 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) was dissolved in ethanol ( 10 mL ) and NaOH 2 N $(25 \mathrm{ml})$ was added. The reaction was heated to reflux for 16 h and TLC of the crude mixture (EtOAc) indicated formation of a new compound ( $R_{f} 0.0$ ) and complete consumption of starting material ( $\mathrm{R}_{\mathrm{f}} 0.95$ ). The ethanol was evaporated in vacuo and the aqueous phase was washed with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). HCl 2 N was added until pH 1 and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to afford the desired ketoacid ( $73 \mathrm{mg}, 84 \%$ yield) as a brown solid. The reaction was scaled up using 1.6 g of the starting material to obtain the desired compound $64(1.09 \mathrm{~g}, 78 \%$ yield) as a brown solid.

Product aspect: brown solid.
Theoretical mass: 87 g .
Mass obtained: 73 mg .
Yield: 84\%.

## Analytical data:

mp: 110-112 ${ }^{\circ} \mathrm{C}$ (EtOAc).
$\mathbf{R}_{\mathrm{f}}=0.10$ ( $\mathrm{EtOAc} / \mathrm{MeOH} 9: 1$ ).
 $\mathrm{H}-5), 8.15$ (d, J= $9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-2, \mathrm{H}-6$ ).

## 3-(4-(Benzyloxy)-3-methoxyphenyl)-4-(3,4,5-trimethoxyphenyl)furan-2,5-dione (79)

2-Oxo(3,4,5-trimethoxyphenyl)acetic acid ( 80 ) ( $96 \mathrm{mg}, 0.40 \mathrm{mmol}$ ) and 4-benzyloxy-3methoxyphenylacetic acid ( 81 ) ( $218 \mathrm{mg}, 0.80 \mathrm{mmol}$ ) were dissolved in acetic anhydride ( 5 mL ) in a flame-dried round-bottom flask under argon. The reaction was heated at $150{ }^{\circ} \mathrm{C}$ under stirring for 2 h and TLC of the crude mixture (hexane/EtOAc 2:8) indicated formation of a bright yellow compound ( $R_{f} 0.90$ ) and complete consumption of starting materials ( $R_{f} 0.60, R_{f} 0.05$ ). The crude mixture was microdistilled ( $135{ }^{\circ} \mathrm{C}$ ) and the resulting residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ and washed with NaOH 0.1 N $(3 \times 20 \mathrm{~mL})$. The combined aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 8:2) to afford the desired compound 79 ( 260 mg ) as an orange solid. Due to stability problems of the anhydride group, the product was used as crude without any further purification.

Product aspect: orange solid.
Theoretical mass: 190 mg .
Mass obtained: 260 mg .

## Analytical data:

Compound 79
$\mathbf{R}_{\mathrm{f}}=0.60$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 3.70\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}-\mathrm{O}(\times 2)\right.$ ), 3.75 ( $\left.\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.89$ ( s , $3 \mathrm{H}, \mathrm{OCH}_{3}$ ), $5.13\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{O}\right), 6.74\left(\mathrm{dd}, \mathrm{J}=1.8 \mathrm{~Hz}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-6^{\prime}\right), 6.82(\mathrm{~s}, 2 \mathrm{H}, \mathrm{H}-2$, $\mathrm{H}-6), 6.89$ ( $\mathrm{d}, \mathrm{J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5^{\prime}$ ), 7.14 ( $\left.\mathrm{d}, \mathrm{J}=1.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2^{\prime}\right), 7.10-7.50$ ( $\mathrm{m}, 5 \mathrm{H}, \mathrm{OBn}$ ).

## (3,6,7,8,9,10-Hexahydro-2H-[1,4]dioxino[2,3-b]carbazol-10-yl)methanol (82)

To the ethyl ester 84 ( $327 \mathrm{mg}, 1.09 \mathrm{mmol}$ ) dissolved in THF ( 20 mL ) was added $\mathrm{LiAlH}_{4}$ ( $164 \mathrm{mg}, 4.32 \mathrm{mmol}$ ) in a flame-dried round-bottom flask under argon. The reaction was stirred at rt for 4 h and TLC of the crude mixture (hexane/EtOAc 8:2) indicated formation of a new compound and complete consumption of starting materials $\left(\mathrm{R}_{\mathrm{f}}\right.$ 0.25). Water ( 30 mL ) was added and the crude mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with water ( 20 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 6:4) to afford the desired alcohol 82 ( 207 mg , $74 \%$ yield) as a colourless liquid.

Product aspect: colourless liquid.
Theoretical mass: 280 mg .
Mass obtained: 207 mg .
Yield: 74\%.

## 3,6-Dihydro-2H-[1,4]dioxino[2,3-b]carbazol-10-yl)methanol (83)

To the ester 85 ( $351 \mathrm{mg}, 1.18 \mathrm{mmol}$ ) dissolved in THF ( 20 mL ) was added $\mathrm{LiAlH}_{4}(164$ $\mathrm{mg}, 4.32 \mathrm{mmol}$ ) in a flame-dried round-bottom flask under argon. The reaction was stirred at rt for 4 h and TLC of the reaction mixture (hexane/EtOAc 8:2) indicated formation of a new compound and complete consumption of starting materials $\left(\mathrm{R}_{\mathrm{f}}\right.$ $0.25)$. Water ( 30 mL ) was added and the crude mixture was extracted with diethyl ether ( $2 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with water ( 20 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 6:4) to afford the desired compound 83 (250 $\mathrm{mg}, 83 \%$ yield) as a colourless liquid.

Product aspect: colourless liquid.
Theoretical mass: 301 mg .
Mass obtained: 250 mg
Yield: 83\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.20$ (hexane/EtOAc 6:4).

## Ethyl 3-bromo-2-oxocyclohexanecarboxylate (87)

Ethyl 2-oxocyclohexanecarboxylate (88) ( $0.94 \mathrm{~mL}, 5.87 \mathrm{mmol}$ ) was dissolved in $\mathrm{CHCl}_{3}$ $(30 \mathrm{~mL})$ in a flame-dried round-bottom flask under argon and cooled to $0{ }^{\circ} \mathrm{C}$ with extern bath. $\mathrm{Br}_{2}(0.50 \mathrm{~mL}, 2 \mathrm{eq})$ was dissolved in $\mathrm{CHCl}_{3}(10 \mathrm{~mL})$ and added to the solution. The reaction was stirred for 72 h . TLC of the crude mixture (hexane/EtOAc 9:1) indicated no $R_{f}$ modification of the new product ( $R_{f} 0.30$ ). The crude reaction mixture was concentrated in vacuo. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$, quenched with $\mathrm{NaOH} 1 \mathrm{~N}(20 \mathrm{~mL})$ and washed with water ( $3 \times 20 \mathrm{~mL}$ ). The aqueous phase was re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 20 \mathrm{~mL})$ and the combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 9:1) to afford ethyl 3-bromo-2oxocyclohexane carboxylate (87) (1.45 g, 99\% yield) as a colourless liquid. This material was identical in all respects with that previously described. ${ }^{118}$

Product aspect: colourless liquid.
Theoretical mass: 1.46 g .
Mass obtained: 1.45 g .
Yield: 99\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.30$ (hexane/EtOAc 9:1).

## 2-Chloro-1-(3,4-dimethoxyphenyl)ethanone (120)

To 3,4-dimethoxy-acetophenone (122) ( $200 \mathrm{mg}, 1.1 \mathrm{mmol}$ ) dissolved in $\mathrm{CCl}_{4}(10 \mathrm{~mL})$ was added NCIS ( $225 \mathrm{mg}, 1.65 \mathrm{mmol}$ ) and $\mathrm{AcOH}(63 \mu \mathrm{~L}, 1.1 \mathrm{mmol})$ in a flame-dried round-bottom flask under argon. The reaction was refluxed under stirring for 92 h and TLC of the crude mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f} 0.75$ ) and complete consumption of starting materials ( $R_{f} 0.65$ ). The reaction mixture was concentrated in vacuo. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$, washed with a saturated solution of $\mathrm{NaHCO}_{3}(3 \times 50 \mathrm{~mL})$ and the aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$. The combined organic phases were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 7:3) affording the desired compound 120 ( 230 mg , $99 \%$ yield) as a pale brown solid.

Product aspect: pale brown solid.
Theoretical mass: 232 mg .
Mass obtained: 230 mg .
Yield: 99\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.75$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathbf{H}\left(\right.$ CDCl $\left._{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 3.95\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 3.97\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{O}-\mathrm{CH}_{3}\right), 4.67(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{CO}-\mathrm{CH}_{2}-\mathrm{Cl}\right), 6.91(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 7.53(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-2), 7.58(\mathrm{dd}, J=2.1$ $\mathrm{Hz}, \mathrm{J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-6)$.

## 2-Bromo-1-(3,4-dimethoxyphenyl)ethanone (121)

To 3,4-dimethoxyacetophenone (122) ( $2 \mathrm{~g}, 11 \mathrm{mmol}$ ) dissolved in $\mathrm{CCl}_{4}(30 \mathrm{~mL})$ was added NBS ( $7,2 \mathrm{~g}, 40 \mathrm{mmol}$ ) and $\mathrm{AcOH}(2.28 \mathrm{~mL}, 40 \mathrm{mmol})$ in a flame-dried roundbottom flask under argon. The reaction was refluxed under stirring for 72 h and TLC of the reaction mixture (hexane/EtOAc 1:1) indicated formation of a new compound ( $R_{f}$ 0.70 ) and uncomplete consumption of the starting material ( $R_{f} 0.65$ ). The crude mixture was concentrated in vacuo. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$, washed with a saturated solution of $\mathrm{NaHCO}_{3}(3 \times 50 \mathrm{~mL})$ and the aqueous phases were re-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{~mL})$. The combined organic phases were dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and concentrated in vacuo. The residue was purified by silica gel flash column chromatography (hexane/EtOAc 7:3) affording the desired compound 121 ( $1.15 \mathrm{~g}, 40 \%$ yield) as a pale brown solid.

Product aspect: pale brown solid.
Theoretical mass: 2.88 g .
Mass obtained: 1.15 g .
Yield: 40\%.

## Analytical data:

$\mathbf{R}_{\mathrm{f}}=0.70$ (hexane/EtOAc 1:1).
RMN ${ }^{1} \mathrm{H}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \boldsymbol{\delta}(\mathrm{ppm}): 3.94\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.96\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 4.67(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{CH}_{2}-\mathrm{Br}\right), 6.90(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 7.53$ (d, $J=2.0,1 \mathrm{H}, \mathrm{H}-2$ ), 7.56 (dd, $J=2.0 \mathrm{~Hz}, 8.4$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{H}-6)$.

1. Of the 3 studied methods for the preparation of the arylethylamine $\mathbf{2 8}$, the more practical and efficient consists in the double alkylation of the 2,3-dihydro-[1,4]-benzodioxin-6-carbaldehyde (40) with 1,2-dibromoethane and $\mathrm{K}_{2} \mathrm{CO}_{3}$, followed by the treatment with nitromethane in the presence of ammonium acetate and reduction with $\mathrm{LiAlH}_{4}$ of the nitro group. The overall yield is $34 \%$. The best method for the preparation of the isoquinoline $\mathbf{3}$ begins with amination of the 3,4,5trimethoxibenzaldehyde (29) with the arylethylamine $\mathbf{2 8}$ in refluxing benzene, followed by the treatment with $\mathrm{H}_{3} \mathrm{PO}_{4}$ in $32 \%$ yield. The tetrahydroisoquinolines $1,4,5,6,7$ were obtained by alkylation of the tetrahydroisoquinoline $\mathbf{3}$ with the corresponding alkyle halide in moderate yield, while 8 and 9 were obtained by treatment of the corresponding arylbromide in cross-coupling conditions in acceptable yields.
2. The dimethoxytetrahydroisoquinoline intermediate 49 was prepared by amination of the 3,4,5-trimethoxybenzaldehyde (29) by treatment with the 2-(3,4dimethoxyphenyl)ethylamine (50) in the presence of PTSA, followed by cyclization of the resulting imine using a trifluoroacetic acid and trifluoroacetic anhydride mixture and hydrolysis of the trifluoroacetamide 51 with NaOH (overall yield $32 \%$ ). The dimethoxytetrahydroisoquinoline 10 was obtained by alkylation of the tetrahydroisoquinoline 49 with 2-chloroethanol, while the dimethoxytetrahydroisoquinoline 11 was obtained by alkylation of 49 with ( $\pm$ )epichlorhydrin, followed by hydrolysis with NaOH in moderate yield.
3. The intermediate vinyl ester 54 was synthesized by benzylation of the 3 -hydroxy-4methoxybenzaldehyde (58) with benzyl bromide followed by treatment with 3,4,5trimethoxyphenylacetic acid (56) under Perkin conditions, and finally the alkylation of the carboxylic acid 53 with iodomethane and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in $24 \%$ overall yield of 3 steps. The same reaction using 4-(methylsulfonyl)phenylacetic acid (60) or 4(thiomethyl)phenylacetic acid (61) instead of 3,4,5-trimetoxyphenylacetic acid (29) was attempted. The difficulties encountered in this synthesis suggest that para substituted sulfone or methylsufonyl groups decrease dramatically the reactivity of the corresponding carboxylic acid.
4. The estilbene derivative 55a was prepared by decarboxylation of the carboxylic acid 53 in high yield. Various reaction conditions were investigated for the cyclopropanation and epoxidation of the estilbene derivative 55a. The negative results in most cases emphasize the difficulty of functionalization of the corresponding olefin. The lack of stability of the desired products is underlined in the case of the epoxides.
5. The pyrazolone $\mathbf{1 6}$ was obtained by treatment of the carboxylic acid $\mathbf{5 3}$ or the ester 54 with hydrazine hydrate at reflux temperature. The catalytic hydrogenation of $\mathbf{1 6}$ in atmospheric pressure yielded the $O$-debenzylated pyrazolone 17 in low yields. The azoledione 15, structuraly related to the combretastatin A-4, was prepared by condensation of the glyoxylic aryl acid 80 with the substituted benzaldehyde 81 in presence of acetic anhydride, followed by the formation of the imine intermediate 14 by treatment of the corresponding anhydride with ammonium acetate and the debenzylation of $\mathbf{1 4}$ by hydrogenation over palladized charcoal in dry ethyl acetate.
6. The dioxancarbazoles $\mathbf{2 1}$ and $\mathbf{2 2}$ were synthesized from the aniline 86 and the bromoketoester 87 under Bishler reaction conditions, followed by the reduction of the dioxancarbazole ester $\mathbf{8 4}$ and $\mathbf{8 5}$ respectively with $\mathrm{LiAlH}_{4}$ in good yields. The alcohol $\mathbf{8 2}$ obtained reacted with the isocyanate 96 in presence of $\mathrm{Et}_{3} \mathrm{~N}$ forming 21 in low yield. Similary, the reaction between the dioxancarbazole-2-ethanol 83 and the isocyanate 95 led to 22 in good yield. The substitution of the alcohol group of the dioxancarbazoles 82 and 83 with a bromine, chlorine or a triflate resulted in the elimination of the corresponding leaving group into the unsaturated by-products $\mathbf{1 0 0}$ or 104.
7. The furan 23 was synthesized by condensation of 3,4,5-trimethoxyphenylacetic acid (56) with 2,4-dihydroxybenzaldehyde (106), $\mathrm{Ac}_{2} \mathrm{O}$ and $\mathrm{Et}_{3} \mathrm{~N}$ followed by the hydrolysis of the corresponding lactone 105 with HCl 2 N and treatment with $\mathrm{BBr}_{3}$ in moderate yield. The indole 21 was prepared by a modified Bischler reaction conditions from the 3-benzyloxyaniline 112 and 2-bromo-1-(2,5-dimethoxyphenyl)ethanone 123, followed by a hydrogenation reaction catalyzed by $\mathrm{Pd} / \mathrm{C}$ in moderate yield. The same modified Bischler reaction conditions using 2-chloro-1-(3,4-dimethoxyphenyl)ethanone (120) or

2-bromo-1-(3,4-dimethoxyphenyl)ethanone (121) was attempted. The negative results emphasize the fact that this reaction does not occur with hindered $\alpha$-halogenated ketones.
9. The compound with the major cytotoxic activity was the pyrazolone 17. This compound shows a high anti-angiogenesis and anti-osteoporosis activity both related with the K-Ras inhibition (HCT-KRASSL $100 \%$ inhib. At $20 \mu \mathrm{M}$ ). The $O$-benzylated pyrazolone 16 presents less K-Ras inhibitory effect than the pyrazolone 17 (a>50\% decrease) and its anti-angiogenesis properties were reduced more than 50 times ( $\mathrm{IC}_{50}$ (16) $\left.>10 \mu \mathrm{M} ; \mathrm{IC}_{50}(17)=0.507 \mu \mathrm{M}\right)$. Compound 17 showed a significant $\mathrm{G}_{2} \mathrm{M}$ cell cycle arrest concretely at the subphase 4 N , as expected for anti-angiogenesis agents. Compound $\mathbf{1 7}$ is a suitable scaffold to optimize in order to achieve the desired profile. It displayed favorable in vitro pharmacological profiles that warrant further investigation.
10. A short series of isoquinolines was readily prepared by our improved synthetic route. Most of the $N$-substituted isoquinolines displayed K-Ras inhibition, but the aminoethyl and the aryl substituents (compounds 5, 8 and 9) led to a novel class of KRas inhibitors possessing high inhibitory potency. Compound 9 showed the most potent enzyme activity (RKO KRASSL 95.8\% inhib. At $0.2 \mu \mathrm{M}$ ).

#### Abstract

The study deals with the synthesis and biological activity of 4 different antitumours: Tetrahydro(1,4)-dioxanisoquinolines, combretastatin A-4, dioxancarbazoles and resveratrol analogues. This study describes the synthesis strategy and multi-step synthesis of these antitumour compounds. Various tetrahydroisoquinolines were synthesized, five of which were biologically tested and have a promising K-ras inhibition activity. Two of them show a high antiangiogenesis activity, one of which also presents antiosteoporosis properties. Two pirazolone derivatives were synthetized and biologically tested, one of which shows a very high K-Ras inhibition, antiangiogenesis and antiosteoporosis activity and inhibits the $\mathrm{G}_{2}$ cell cycle phases and subphases. Two Azoledione combretastatin A-4 derivatives were also synthesized and will be biologically tested. Two dioxancarbazoles were prepared and biologically tested, one of which shows a high K-ras and angiogenesis inhibition. Finally, four resveratrol analogues were synthesized and biologically tested. Biological results show a moderate and selective K-ras inhibition on the studied cell lines. In the future, the rest of the synthesized compounds are to be biologically tested. Further CDK and topoisomerase II inhibition trials as well as toxicity studies will be carried on.
