2008

ACKNOWLEDGEMENTS

During the preparation of this dissertation, I have received help and advice from many people, to whom I would like to express my gratitude.

My greatest debt is to my supervisors, without their dedication this project would have never been possible. I feel really lucky to have had the privilege to work with Dr Carme Muñoz and Dr Paul Meara.

From the very beginning, Dr Muñoz has offered me invaluable guidance and unwavering support, I will never thank enough all the help she has offered to me in this dissertation as well as in other aspects of my work. I would like to thank her for her strong commitment with the thesis, her never-ending patience, her constant supply of feedback and her scrupulous revision of the drafts. She has made many indispensable comments and given illuminating insights and advice and I have benefitted from her expertise in many different areas. In addition, her kindness, her constant encouragement and personal qualities have made the preparation of this dissertation much easier and the work with her a great pleasure.

I am indebted as well to Dr Meara, who allowed me to make my first research stay in Swansea in 2002 and has enormously helped me ever since. He has contributed to the present work in countless ways. He has allowed me to dig into his archives for publications and to actively participate in the creation of computer tools, which I have really enjoyed. I am extremely grateful for his indications to work with the data and for his detailed comments on my work, they have always been an incentive to go on and a spur of motivation. In addition to possessing outstanding academic qualities, he has always been very helpful, patient and supportive and I thank his generosity in sharing his knowledge and skill with me.

I owe also a great deal to all the members of the BAF ('Barcelona Age Factor') Project, I would like to thank them all for their contribution to my development as a researcher and also because, from the time I started working with them as a research assistant, they have always been a source of motivation. I am especially grateful to Dr M.Luz Celaya for her help in one of my DEA projects, which later on gave birth to an idea for this thesis. I have also learned a lot with Dr Teresa Navés, from whom I have received help in uncountable aspects, from computer tools to statistics; she has provided me with bibliography that offered much food for thought. I have also gained insights into various research fields thanks to Dr Elsa Tragant.

I would like to express my sincere gratitude as well to Dr Joan Carles Mora for making easier the task of combining teaching and research during the last few years. I also thank Dr Roger Gilabert for his willingness to help this last semester, when this thesis was coming to an end and Dr Raquel Serrano, for sharing with me the last stages of her thesis completion.

Former or present research assistants of the project have also offered me their help and friendly encouragement and therefore I thank Dr Josep M^a Armengol, Laura Sánchez, M.del Mar Suárez, Júlia Barón, Cristina Aliaga, Àngels Llanes and Anna Marsol. I would also like to express my heartfelt thanks to Dr Natàlia Fullana, who has shared with me the preparation of this work from the very beginning, helping me to choose the right path on different occasions, and to Gisela Grañena, who has offered me constant support and bibliography even in the distance. I also thank the schools, teachers and children who took part in the project for their willing cooperation.

I should like to record here my deep appreciation to the people at the Centre for Applied Language Studies at the University of Wales Swansea, who took interest in my research and let me share my research stays with them. Dr James Milton gave me access to the department and university services and offered interesting suggestions for my work. Dr Núria Lorenzo-Dus also gave me expert advice and great encouragement. Dr Jim Ronald, Mitsuru Orita, Masa Mochizuki and Tad Kamimoto made useful comments at early stages of my research. I also thank them all because, together with Giovanna Donzelli, Dr Thomai Alexiou and Nikos Konstantakis, have made of my stays in Wales an enjoyable experience.

I am thankful to Dr Laura Collins for sharing with me her latest work and making very sensible suggestions on my research, for which I am indeed grateful. Thanks also to Ferran Carrascosa for his help with statistics and to the colleagues at the English Department, who have always showed me their support, especially to Dr Guàrdia.

I gratefully acknowledge the financial help of the grant 2001FI-0062 from Generalitat de Catalunya ('Formació de Personal Docent i Investigador'), which allowed me to work as a research assistant for four years and to spend time abroad to prepare the present work. This research has also been partly supported by the grants BFF2001-3384 and HUM2004-05167 from the Ministry of Education of Spain to the BAF Project and by the designation of the BAF research group as 'Grup Consolidat de la Generalitat' (2005SGR00778).

Finally, I thank Carol and Eric Davies, who made me feel at home in my stays in Swansea and last, but not least, I owe gratitude to my family and friends, who allowed me time to carry out this work. Above all, I would like to thank my parents, to whom I dedicate this thesis, for encouraging me to choose what I liked and for their understanding and support at all times. I also thank Jordi for all his help along the way and for always being there.

To Montserrat and Lluís

SUMMARY

This dissertation analyses the effects of age on the acquisition of vocabulary in English as a Foreign Language (FL). It focusses on productive vocabulary because it is a crucial aspect in language learning which is also vital in communication, both oral and written, and it has often been the neglected component in research on age.

Studies on age in naturalistic contexts have usually shown that ‘the earlier one starts learning the language, the better’. Although in the short term Early Starters (ES) are outperformed by Late Starters (LS), due mainly to the superior cognitive maturity and the quickest rate of development of the latter, in the long run ES will catch up with LS and will eventually overtake them. Our educational system also promotes an early start to the FL, as the age at which English is first introduced at schools has progressively been brought down in the recent years. However, results in instructional settings are not as clear-cut as the ones obtained in natural contexts and ‘the earlier the better’ assumption does not always seem to apply in a straightforward way. The present work analyses the oral and written production of two groups of Catalan/Spanish bilinguals who learn English at school as a FL. One of the main aims of the research is to determine if, in the long term, towards the end of secondary education, there are consistent differences between a group of ES (who started at 8) and one of LS (who started at 11) as regards productive vocabulary. The design presented also allows to study the development and draw comparisons between the groups from primary education onwards (data collections were carried out after 200, 416, 726 and 800 hours of exposure). Therefore, the analyses are performed by controlling the Amount of Exposure that learners have received, their Cognitive Maturity (Age at Testing) and their Age of Onset (Starting Age).

In order to analyse the participants’ production, both intrinsic and extrinsic vocabulary measures are used. It is also a research purpose of the present work to survey some of the widely-used measures of lexical richness and to evaluate new ones, such as *D* and *P_Lex*. In addition, as the Second Language Acquisition research field is very much in need of testing tools, especially as regards vocabulary, this thesis presents one of the first methods to compute estimates of productive vocabulary size for different tasks. The process to carry out the estimations has been automated into *V_Size*, a new computer tool.

Results show that in the long term, ES do not surpass LS in a formal context as far as lexical production is concerned. The same takes place even if ES receive some more exposure. This LS advantage seems to be present since the first stages of learning the FL, even though both groups show a boost in vocabulary from the age of 13 onwards. The findings are discussed in the light of other results found in natural and formal contexts for lexis and other language components. They are also interpreted in relation to other factors that may contribute to a successful learning apart from an early start. Results on different lexical measures are considered for research in the field and potential advantages of the new *V_Size* are described. Therefore, not only does the thesis bring new evidence to research on age and FL acquisition, but it also offers new insights into productive vocabulary testing.

RESUM

Aquesta tesi analitza els efectes del factor edat en l'adquisició de vocabulari en anglès com a llengua estrangera. Es centra en vocabulari productiu perquè és un aspecte crucial en l'aprenentatge de llengües que també és molt important per la comunicació, oral i escrita, i ha estat sovint el component oblidat en recerca sobre edat.

Els estudis sobre el factor edat en contextos naturals mostren que és millor començar a aprendre un idioma el més abans possible. Tot i que a curt termini els aprenents més grans siguin millors que els joves, sobre tot a causa de la maduresa cognitiva i del ritme ràpid de desenvolupament dels primers, a llarg termini els més joves atrapen els grans i arriben a depassar-los. El nostre sistema educatiu també promou un començament primerenc de l'anglès, ja que l'edat en què l'idioma estranger és introduït a les escoles és cada vegada més baixa. Tanmateix, els resultats en contextos d'instrucció no són tan clars com els obtinguts en contextos naturals i la suposició de 'quan abans millor' no sembla del tot certa. Aquest treball analitza la producció oral i escrita de dos grups d'estudiants bilingües català/castellà que aprenen anglès com a llengua estrangera a l'escola però que començaren a edats diferents (uns als 8 i els altres als 11). Un dels propòsits de la recerca és determinar quin dels dos grups serà més competent a llarg termini, al final de la Secundària, pel que fa al vocabulari productiu. El disseny permet també estudiar el desenvolupament i establir comparacions entre els dos grups des de l'educació primària (es portaren a terme recollides de dades després de 200, 416, 726 i 800 hores d'aprenentatge). Les anàlisis controlen, per tant, les hores d'exposició, la maduresa cognitiva i l'edat d'inici de l'anglès.

Per tal d'analitzar la producció dels aprenents s'han utilitzat mesures de vocabulari intrínseques i extrínseques. És també objectiu d'aquesta tesi estudiar algunes de les mesures més utilitzades en lèxic així com avaluar-ne de noves com la *D* i el *P_Lex*. A més, com que el camp de recerca en Adquisició de Segones Llengües necessita eines d'avaluació, especialment en vocabulari, es proposa en aquest treball un dels primers mètodes per realitzar estimacions del tamany de vocabulari productiu dels aprenents per diferents tasques. Aquest procés d'estimació ha estat computeritzat en el programa *V_Size*, una nova eina informàtica.

Els resultats indiquen que, a llarg termini, els aprenents més joves no avantatgen els més grans en contextos formals a igualtat d'hores d'exposició pel que fa a vocabulari productiu, encara que els més joves hagin començat abans; tampoc si aquests han rebut més hores d'exposició. Aquest avantatge dels més grans sembla ser present des dels estadis inicials d'aprenentatge, tot i que hi ha un desenvolupament notable als voltants dels 13 anys en ambdós grups. Els resultats són posats en relació a altres estudis en contextos formals i naturals tant pel que fa a vocabulari com per altres components lingüístics. Així mateix, són interpretats en relació a altres factors que poden ser tan o més importants que una jove edat d'inici. També els resultats obtinguts de les diferents mesures lèxiques són considerats per recerca en el camp i es descriuen els possibles beneficis derivats del nou mètode d'estimació de tamany de vocabulari. Per tant, la tesi ofereix no només noves evidències a la recerca sobre el factor edat en l'adquisició de llengües estrangeres sinó també nous mètodes d'anàlisi de vocabulari productiu.
