

6 Síntesi i caracterització de productes que contenen la unitat oxazolidin-2-ona

- N,N-bis(5-(N-oxazolidin-2-ona)-3-tiapentil)anilina (8)**

En un baló de tres boques de 1000 ml realitzem una suspensió de Cs_2CO_3 (5.38 g, 16.5 mmol) en 600 ml de DMF seca i desoxigenem mitjançant bombolleig de nitrogen. Preparem una dissolució de N,N-bis(2-mercaptoetil)anilina (**7**) (2.37 g, 11 mmol) i una solució de bis(2-cloroetil)amina clorhidrat (**1**) (1.98 g, 11 mmol) en 50 ml de DMF seca i desoxigenada, respectivament. Sobre la suspensió de Cs_2CO_3 en agitació intensa s'addicionen a temperatura ambient les dues solucions de manera simultània a una velocitat de 2 ml/h mitjançant un perfusor. Un cop finalitzada l'addició mantenim la solució resultant en agitació durant 24 h. Filtrem i evaporem el dissolvent, restant un oli groguenc molt dens. Realitzem extraccions amb èter etílic en primer lloc (2 x 200 ml) i finalment amb clorur de metilè (2 x 200 ml). Evaporem el clorur de metilè i obtenim un sòlid que purifiquem dissolent-lo en la mínima quantitat de clorur de metilè i fent-lo precipitar en forma de sòlid blanc microcristal·lí afegint 2-3 ml de ciclohexà i èter de petroli (1.23 g, 51%). Anàlisi trobat (calculat per $\text{C}_{20}\text{H}_{29}\text{N}_3\text{O}_4\text{S}_2$): C, 53.16 (54.64); H, 6.29(6.65); N, 9.27(9.56); S, 14.25 (14.56). P.m.: 439.60 g/mol. Ió $[\text{M}]^+$ trobat per espectroscòpia de masses d'impacte electrònic.

■ 3-(2-cloroetil)-oxazolidin-2-ona (9)

Refluïm durant 5 h una suspensió del bis(2-cloroetil)amina clorhidrat (**1**) (3.10 g, 17 mmol) i Cs₂CO₃ (6.42 g, 18 mmol) en 100 ml de DMF. Evaporem el dissolvent i obtenim un oli de color ocre molt dens. Realitzem diverses extraccions amb èter etílic (3 x 100 ml) i finalment, després d'evaporar el dissolvent, obtenim un oli groc que cristal·litza en forma de petites agulles (1.32 g, 51%). Anàlisi trobat (calculat per C₅H₈NO₂Cl): C, 40.15 (40.12); H, 5.68(5.39); N, 9.63 (9.36). P.m.: 149.58 g/mol. I₆ [M]⁺ trobat per espectroscòpia de masses d'impacte electrònic.

■ **6-oxa-1,11-bis(N-oxazolidin-2-ona)-2,10-ditiaundecà (10)**

En un baló de 250 ml preparem una dissolució de 2-mercptoetil (0.50 g, 3.6 mmol) en 100 ml de metanol desoxigenat, afegim NaOH (0.288 g, 7.2 mmol) i escalfem lleugerament. Addicionem, gota a gota, sobre aquesta dissolució de ditiolat una dissolució de 3-(2-cloroetil)-oxazolidin-2-ona (1.076 g, 7.2 mmol) en 50 ml de metanol desoxigenat. Agitem durant 24 h, evaporem el dissolvent i obtenim un oli ocre força fosc i que dissolem en clorur de metilè per tal de precipitar el NaCl format. Realitzem una columna en sílice utilitzant com eluent una solució de cloroform-metanol (10:1), descartem les primeres fraccions eluïdes i finalment obtenim el producte en forma de oli groc fosc molt dens (0.52 g, 40%). Anàlisi trobat (calculat per $C_{14}H_{24}N_2O_5S_2$): C, 46.39 (46.14); H, 7.18 (6.64); N, 6.39 (7.69); S, 17.60 (20.09). P.m.: 365.48 g/mol. 7 Complexos. Síntesi i caracterització

7.1 Complexos de Pd(II)

- **Síntesi general i caracterització**

Dissolem la sal de $[Pd(CH_3CN)_4](BF_4)_2$ en acetonitril (5 ml) i sobre la solució groga resultant addicionem a poc a poc una solució del lligand corresponent en clorur de metilè (5ml). Portem a reflux la solució durant 2 h i agitem durant 12 h a temperatura ambient. Evaporem els dissolvents, afegim èter etílic (25 ml), agitem durant 30 min i filtrem el sòlid obtingut. Realitzem rentats amb clorur de metilè, per tal d'eliminar l'excés de lligand, i èter etílic.

En el cas del complex $[Pd(L17)](BF_4)_2$ es fa reaccionar un excés de metall perquè la purificació del complex obtingut es realitza dissolent aquest en clorur de metilè per separar-lo de l'excés de metall que no ha reaccionat.

Els complexos dels lligands fosfamacrocíclics s'han sintetitzat emprant tècniques Schlenk i dissolvents perfectament desoxigenats.

7.2 Complexos de Cu(II)

■ Síntesi general i caracterització

Com a sals de partida s'ha emprat $\text{Cu}(\text{ClO}_4)_2 \cdot 6 \text{ H}_2\text{O}$ i $\text{Cu}(\text{BF}_4)_2 \cdot n \text{ H}_2\text{O}$ (20-22% en Cu).

Dissolem el macrocicle en clorur de metilè (5ml) i l'afegeim sobre una solució de la sal metàl·lica en etanol absolut (25 ml). La solució esdevé de color verd fosc. Agitem durant 12 h, evaporem el dissolvent i afegeim èter etílic. Agitem durant 30 min i finalment obtenim una precipitat que rentem diverses vegades amb etanol i èter etílic.

El complex $[\text{Cu}(\text{ClO}_4)(\text{L1})]\text{ClO}_4$ s'extreu del cru de reacció amb clorur de metilè. El complex $[\text{Cu}(\text{L2})](\text{BF}_4)_2$ precipita completament en el si de la reacció.

7.3 Complexos de Ni(II)

▪ Síntesi general i caracterització

Dissolem el macrocicle en clorur de metilè (5ml) i l'afegim sobre una solució de $\text{Ni}(\text{ClO}_4)_2 \cdot 6 \text{ H}_2\text{O}$ en acetona (5 ml) observant immediatament canvis de color en la solució. Agitem durant 12 h, evaporem el dissolvent i afegim èter etílic (25 ml). Agitem durant 30 min i finalment obtenim un precipitat que rentem diverses vegades amb clorur de metilè i èter etílic. La síntesi del complex $[\text{Ni}(\text{L17})](\text{ClO}_4)_2$ també es va realitzar emprant acetonitril en lloc d'acetona, obtenint el mateix resultat.

Els complexos de Ni(II) pentacoordinats es sintetitzen per addició de solucions dels corresponents halurs (2 ml) en forma de sal de tetrabutilamoní ($n\text{-Bu}_4\text{N}X$) sobre solucions del complex $[\text{Ni}(\text{L17})](\text{ClO}_4)_2$ en acetonitril (2 ml). Un cop realitzada la mescla, s'agita durant tota la nit, s'evaporen els dissolvents de síntesi i es dissol el sòlid obtingut en la mínima quantitat d'una dissolució calenta de clorur de metilè-toluè 1:1. Els cristalls porpres formats després de l'evaporació parcial del clorur de metilè, es filtreuen, es renten diverses vegades amb èter etílic i s'assequen al buit.
