

# Acknowledgments

Besides the human effort that I have dedicated from beginning to end of this work, there has also been a great amount of external help and participation in a temporary and continuous mode in the development of this dissertation. Three basic supports have been the most important: economic, technical and personal encouragement. Although, they are independent of each other, the absence of one of these would have hindered the achievement of the objectives proposed in the beginning of this work. For these three supports, I want to dedicate this section.

Within the economic support, first, I want to thank my parents for helping me throughout. I also want to thank: the *ESPOL University* from Ecuador for the help that they have given me, the *Spanish Agency for International Cooperation* (AECI) for the “Mutis” fellowship, *FUNDACYT* from Ecuador for helping me in the culmination of my doctoral thesis, the *Polytechnic University of Catalonia* (UPC) for the additional economic assistance I received at the time it was most required. I would also like to thank the *Institute of Organization and Control of Industrial Systems* (IOC) at the UPC (former *Institute of Cybernetics*) for allowing me to make use of their resources and also for making it possible for me to attend the *IEEE International Conference on Image Processing* in Japan in 1999. Moreover, I give a very special thanks to my advisor Dr. Miguel Angel García for helping me with registration fees for different conferences where our works were published.

In addition, within the technical support, I also want to express my most sincere gratitude to Dr. Miguel Angel García for introducing me to the field of approximation and processing of digital images with adaptive triangular meshes, as well as for the entire technical advice that has been given to me from beginning to end for the development of this thesis. I would also like to thank the following people: Prof. Luis Basañez for offering me the possibility to work with the *Industrial and Service Robotics* research group at IOC, Richard Shewchuk from the *School of Computer Science* at the *Carnegie Mellon University* for providing me with a 2D Delaunay triangulation algorithm, Alan Murta from the *Depart-*

*ment of Computer Science* at the *University of Manchester* for providing me with the polygon clipper algorithm, Jan Rosell for allowing me to use his 3D visualization program, Raúl Suárez and Carlos Rasso from the IOC at the UPC, and the *Signal Analysis and Machine Perception Laboratory* at the *Ohio State University* for providing me with some range images in order to test my algorithms. Additionally, a very special thanks to my doctorate partners and colleagues who assisted me in some questions which arose during my thesis, and also to the staff of the IOC whose collaboration somehow made the termination of this work possible.

Finally, within the personal encouragement support, my sincerest gratitude to my parents, brothers and sister, Dr. Miguel Angel García, partners of the IOC and all the people that knew how to animate the spirit in the difficult moments.
