

« Tota experiència és una dinamització d'energies »

Antonio Blay

Acknowledgments

I am deeply grateful to Javier Dies Llovera, my thesis director, for having made this work possible. He launched me on this adventure, and I have received high-value support from him throughout the thesis.

I am most appreciative of the hospitality shown to me during this three-year thesis work at the heart of the *Département de Recherches sur la Fusion Contrôlée* of the *Commissariat à l'Énergie Atomique* (Cadarache). I am grateful to Jérôme Paméla, Michel Chatelier, and Jean Jacquinot, successive Heads of the Department; to Bernard Saoutic, Head of the Service of Heating and Plasma Confinement; to Xavier Garbet, Head of the Core Plasma Theory Group, for enabling me to carry out this work in an excellent technical and scientific environment.

I would particularly like to thank Jean Johner, co-director of this thesis and my daily supervisor at the DRFC, with whom I have spent uncountable hours engaged in enjoyable and enriching discussions. His broad background in physics and engineering, his rigorous work, and his methodology, have contributed significantly to my scientific and human apprenticeship.

I wish to acknowledge the contribution of Gerardo Giruzzi in offering valuable suggestions as my initial Group Head, stimulating useful discussions throughout this work, and carefully reading this manuscript.

I wish to thank Marino Bornatici and Folker Engelmann for reading the manuscript with a critical eye and making several useful comments. Their interest and dynamism have motivated the continuation of this work in the Università degli Studi di Pavia; my thanks also goes to Xavier Ortega and Carlos Alejaldre for accepting to be the president and a member of the thesis evaluation committee in Barcelona.

I am also grateful to the DRFC team for the help they offered me, and particularly to Jean-Luc Duchateau, Patrick Hértout, Jean-Marc Ané and the rest of the EPDIM group for the sympathy shown to me and their contribution to Chapter 5 of this thesis. I thank all the PhD, year-out students, and foreign collaborators of the DRFC that I was lucky enough to meet in Cadarache and with whom I shared the day-to-day routine. I am indebted to the Scientific Computer Team of the CEA-Grénoble and to Chantal Passeron (being always in a contagiously good mood) for their support in the numerical calculations of this thesis, and to Giovanni Granata for his aid in the mathematics issues of Chapter 3.
