Introduction	5
1 Nuclear fusion and the energy problem	8
1.1 Prospective of the energy use growth	8
1.2 Primary energy sources	10
1.3 Fusion energy	11
1.4 Thermonuclear fusion by magnetic confinement	13
2 Thermal equilibrium of the plasma	17
2.1 Introduction	17
2.2 The thermal equilibrium equation	17
2.2.1 Plasma composition	18
2.2.2 Plasma power sources	18
2.2.3 Plasma power losses	22
2.2.4 Peak heat flux on the divertor target plates	24
2.3 Conductive-convective heat transport within a fusion plasma	26
2.3.1 Determination of the global energy confinement time τ_E from a local modelling of heat transport	26
2.3.2 Classical, neoclassical and anomalous models for the thermal diffusivity	27
2.4 Experimental scaling expressions for the global energy confinement time	32
2.4.1 L-mode	33
2.4.2 H-mode	34
2.4.3 L-H transition power threshold	35
2.4.4 The L-mode and ELMy H-mode softly mixed scaling $\tau_{E,mix}$	35
2.5 Plasma stability domain	36
2.5.1 Density limit	36
2.5.2 Beta limit	37
2.5.3 Safety factor	37
2.6 Plasma geometrical description	38

CONTENTS

2.6.1	Plasma surfaces and volume	39
2.7	Helium content of the plasma	41
2.7.1	Case of a simple monomial energy confinement time	41
2.7.2	Case of a softly mixed scaling for the energy confinement time	42
2.8	Non-inductive current drive operation	44
2.8.1	Bootstrap current	46
2.9	Summary	47
3	Study of synchrotron power losses in tokamak plasmas	48
3.1	Introduction	48
3.2	Physics issues	49
3.2.1	Electron cyclotron frequency	49
3.2.2	Radiation emission in the absence of absorption	50
3.2.3	The radiative transfer equation	51
3.2.4	Radiation absorption by the plasma	53
3.3	Global synchrotron power losses and transparency factor	55
3.4	Review of synchrotron loss studies	57
3.5	Synchrotron losses in cylindrical plasmas	58
3.5.1	Homogeneous plasma with circular cross-section	59
3.5.2	Trubnikov's method for the calculation of the absorption coefficients	60
3.5.3	Reproducing the Trubnikov's calculation	62
3.5.4	Elliptical plasma cross-section: extension of Trubnikov's fit	63
3.6	Comparison of the Trubnikov's method for the calculation of the absorption coefficients, with a quasi-exact method	65
3.7	Spatial density of the synchrotron power loss in terms of emission	68
3.7.1	Formulation of the problem	69
3.7.2	Case of a plasma with cylindrical geometry	72
3.8	Radiation transport in a toroidal geometry	75
3.8.1	Explicit expression for the calculation of synchrotron power loss	75
3.8.2	Aspect ratio effect	82
3.8.3	Effect of temperature profiles	83
3.8.4	New fit for the calculation of global synchrotron losses	88
3.9	Summary	92
4	Prospective study of ITER-FEAT	95
4.1	Introduction	95
4.2	The ITER project	96
4.2.1	From ITER-FDR to ITER-FEAT(historical review)	97
4.3	Geometry, magnetic field, safety factor	98

CONTENTS

4.4	Profiles and impurities	99
4.5	Other assumptions	100
4.6	Inductive mode of operation	101
4.6.1	Sensitivity of $\tau_{\text{He}}^*/\tau_E$ to the plasma performance	102
4.6.2	Relationship between Q and the additional power P_{add}	104
4.6.3	Operating point with a softly mixed scaling	106
4.7	Steady-state operation	108
4.7.1	H-mode conditions	109
4.7.2	Advanced confinement regime	110
4.7.3	The role of density profile	112
4.7.4	Optimal operating points in steady-state operation at $\Phi_{\text{div-peak}} = 10 \text{ MW/m}^2$	113
4.8	Summary	114
5	Design of a $Q = 5$ tokamak	116
5.1	Introduction	116
5.2	Tools for tokamak design	117
5.2.1	Physics model	117
5.2.2	Technical basis description of the magnetic systems	118
5.3	Optimisation algorithm	123
5.4	Design basis and performance	126
5.4.1	Aspect ratio $A = 3$	126
5.4.2	Aspect ratio $A = 3.5$	129
5.4.3	Aspect ratio $A = 4$	131
5.5	Comparison of the optimized machines at aspect ratios 3, 3.5 and 4	133
5.6	Estimation of synchrotron power losses	135
5.7	Additional considerations	137
5.8	Summary	138
6	Reactor studies	140
6.1	Introduction	140
6.2	Parameters of the plasma reactor	140
6.3	Global power plant efficiency and electrical power available into the network	142
6.4	Operation mode and confinement regime	144
6.5	Performance analysis	145
6.5.1	Maximum plasma amplification factor at $r = 0.9$	145
6.5.2	Plasma performance sensitivity to the wall reflection coefficient	148
6.5.3	The role of the current drive efficiency	149
6.6	Optimal confinement enhancement factor H_H	151

6.6.1	Optimisation of Q versus the optimisation of H_H	151
6.6.2	Analytical expressions when imposing the density and the normalized beta limits	153
6.7	Summary	161
Conclusions		163
A Plasma geometrical description		166
A.1	General parametric equations	166
A.2	Geometry description with 8 parameters	167
A.2.1	Parametric expressions for the LCMS	167
A.2.2	Poloidal surface integration	171
A.2.3	Volume integration	173
A.2.4	Plasma surface integration	176
B Dielectric tensor		181
B.1	Anti-Hermitian part of the dielectric tensor	181
B.1.1	Asymptotic expansion for the modified Bessel function . . .	183
B.2	Appleton-Hartree equation	185
C Multivariable regression for the synchrotron losses fit		187
C.1	The best monomial fit	187
C.1.1	Results and examination of residuals	190
C.2	Addition of interaction terms to the regression model	190
C.2.1	The multidimensional weighted least-squares method	192
C.2.2	Selection of the regression model	193
Bibliography		196
Publications associated to the thesis		201
