

List of tables

1.1 Temperature dependence of the detrapping time constant for the A-center.	7
2.1 Component dimensions of a module with a small sensor.	15
2.2 Component materials that can be used in a silicon module.	18
2.3 Thermoelastic properties of materials often used in silicon microstrip detector modules.	20
2.4 Materials, boundary conditions and results of the thermal simulations.	24
3.1 Coefficients of interpolation function 3.1 for Stycast® 1266, Type L and Araldite® 2011.	43
3.2 Pure Araldite® 2011, Stycast® 1266 and Type L mechanical properties.	46
3.3 Filled Stycast® 1266 mechanical properties at 77 K and 300 K.	47
3.4 Filled R&G Type L mechanical properties at 77 K and 300 K.	48
3.5 Stress induced in a silicon-epoxy-silicon when thermal cycled to liquid N ₂ , as obtained in the finite element simulation.	52
4.1 Dimensions and materials of the tested mechanical module.	55
4.2 Position of the Pt-100 thermometers on the mechanical module.	56
4.3 Operating conditions of thermal tests 1,2 and 3.	60
4.4 Parameters from the linear fit for each temperature sensor (test 1).	61
4.5 Fit parameters comparison between tests 1, 2 and 3.	62
4.6 Operating conditions of test 4.	63
4.7 Heat transfer coefficients used in the simulation of the thermal test 1.	67
4.8 Parameters from the linear fit of simulated data for each temperature sensor (test 1).	69
5.1 Large module component dimensions and materials.	72
5.2 Contributions of the components to the total thickness of the cryogenic module.	72
5.3 Rise time as a function of temperature in peak and deconvolution mode with inverter off.	80
6.1 Errors for a, b and cov(a,b)	91
6.2 Offset applied to the tracker planes to align their centers respect to the TOB 1.	92
6.3 Results of the fits for the three runs at different bias potentials (statistical error only).	98
6.4 Statistical and systematic errors of the effective gap width.	103
6.5 Errors in the measurement of the gap on the metrology table.	103
