

## Appendix A

# Benchmark Images

The image sets forming the benchmark for comparison between algorithms in this Ph.D. dissertation come from different corpus. This appendix briefly describes each of the images classes included in the experimental corpus. All images have 8-bit depth. Tables provide the name and size of the images. An example of image for each class is also given.

- **Natural Images:** In this work, *natural images* refers to a generic set of natural scene images. The 25 images in table A.1 are used.
- **Synthetic Images:** Different kinds of synthetic images compose this class: two extracted of the JPEG2000 test set, other obtained from internet data bases, and others designed on purpose to test specific features of the algorithms. See table A.2. Image “crosses”, used to illustrate a wavelet decomposition in §2.1.3, is a 256x256 image obtained from <http://links.uwaterloo.ca/bragzone.base.html>.
- **Texture Images:** Several textured images have been employed in the experiments. In table A.3 appear their name and sizes.
- **Biomedical Images:** The biomedical image set consists of three different corpus: mammography, axones, and MRI brain images.
  - **Mammography:** A set of 15 mammography is employed. Sizes are shown in table A.4.
  - **Axones:** The axones class is a set of 9 medical images that have a size of 512x512 pixels.
  - **Magnetic Resonance Imaging (MRI):** This class is a group of 3-D human head images. They are a slice by slice view of the inside of a human head. The set is formed by 96 images of 256x256 pixels.

**Table A.2:** Set of synthetic images.

- **Remote Sensing Images:** Two different kinds of remote sensing images appear in this work:
  - **SST images:** Sea Surface Temperature (SST)images are obtained with the *Advanced Very High Resolution Radiometer* sensors (AVHRR/2&3) from the *National Oceanic and Atmospheric Administration* (NOAA) satellite series [[U.S.](#)]. Images size range from 5 to 7 Mbytes. This specific set (table A.5) is devoted to the African northwest.
  - **MOC images:** Images collected by the Mars Global Surveyor (MGS) Mars Orbiter Camera (MOC) narrow angle imaging since 20 August 2003. Images are archived in final form with the NASA Planetary Data System (PDS) in [[Jet](#)], where can be found with the name R20-00258p, R20-00329p, R20-00387p, R20-00485p.gif, R20-00502p, R20-00725p, R20-00923p and R20-01188p, instead of MOC-1 to MOC-8. They are listed in table A.6.
