

Figure 1. Acrylamide gel showing the RFLP patterns, obtained by using the endonuclease *Pst*I, of 16S rRNA gene amplified by PCR. Lanes: 1, pattern typical of *Aer. bestiarum* (strain CECT4227^T); 3, pattern typical of *Aer. salmonicida* (strain CECT894^T); 2 and 4, mixture of the two previous patterns (strains J4N-98 and LMG13662, respectively).
